ENGLAND UNDER THE TUDORS AND STUARTS

I

INTRODUCTORY

THE two centuries stretching between 1485 and 1688 can never become indifferent to the people of England, for in them modern England was made. The change from the Middle Ages was accomplished with startling rapidity. At the opening of the period national security was still threatened by nobles ruling whole counties with armed vassals, or by pretenders to the throne, financed from foreign States. Cardinals of the universal Church, their crosses borne before their barges on the Thames, dominated the Councils of the Crown; Convocation was still voting subsidies to crusades against the Turk; a thousand abbeys, friaries, and nunneries, held perhaps one-tenth of English soil. The fabric of government was still medieval. The King in Council carried

on the everyday work of administration; intervals of five years often elapsed between the meetings of Parliament. Economically, men of average means lived in much isolation. Each manor produced two-thirds of its needs; guilds and crafts traded mainly in local markets. England as a power in Europe was little advanced since the days of the Black Prince; Calais was still English, and France the old rival. The keys of commerce were still turned by Venice, Flanders, and the Hanse Towns. The Cape of Good Hope was not yet rounded, America as yet only a traveller's tale. The world seemed to be fixed so fast that it could not be moved, and the horizons of men's minds were flat and narrow. Though Caxton had already printed some fifty books, the new art had not yet reached the stage of common use, and the Court poets and chroniclers of the first Tudor, the theology of his bishops, or the popular drama that he yawned over on his progresses, were still Catholic, wooden, and conventional. If the fifteenth century had been by no means a prison-house, it had been little more than a preparatory school, where pioneer efforts to break out of fixed habits had been rigorously repressed, and where the doom for the heretic or iconoclast had been the stake or wholesale execution.

By 1688 the England in which we live had been, in bare essentials, created, and the problems of William III turned upon Cabinet government, a weekly Press, organized Non-conformity, capitalism, and an empire overseas. Whatever else came of those complicated processes labelled "Renaissance" and "Reformation," their effect was to sweep away, first in men's minds and then from the earth, the checks, balances, and restrictions which had made a communal life possible in the Middle Ages. The State and individual liberty grew up together—the lion with the lamb. When castle, manor, and guild broke down, the individual turned to a central power for direction and defence, while the young State appealed to the growing wealth of the individual bourgeois against relics of feudalism, fetters of Rome, or threats from new monarchies of Europe. The revival of classical teaching gave to both State and individual a brilliant justification for their revived existence; the religious Reformation cast over them the mantle of the spirit. By 1560, amid the dust of demolished medievalism, two mighty forces in England stood erect, two things, their champions claimed, each in some sense divine and elemental—the power of the State and the liberty of man.

One generation had been enough for this mighty change, the lever of which had been a public opinion multiplied by the printing-press. To this both the sovereigns and their critics appealed. Henry VIII combated revolt as much by imperious proclamations as by force of arms, and elined his Reformation by sending the English Bible to every parish. Protestants and Catholics issued libels against their rivals, or ballads to honour their martyrs. Elizabethan secretaries and members of Parliament analyzed in print the institutions they administered. The pamphlet did the work both of newspaper and magazine, and one bookseller's collection of thirty thousand during the Civil War may give some idea of the earlier output. Thames-bank was full of theatres playing to popular audiences; dramatic companies toured the provinces; Burghley "tuned" the theatres to attack Catholic and Puritan.

This intellectual ferment could not leave untouched the centre of English life, and in Elizabeth's later parliaments we may see already the future controversies of Church and State, under discussion by a trained political class, whose arguments prepare us for the division between Whig and Tory.

A new ruling class of squires, lawyers, and

merchants controlled this volume of public opinion. Their instinct of order had rescued the Tudors from rebels. To them were distributed the riches of the Church, to them committed the tasks of local government, that fell from the hands of nobility or guilds. National wealth bounded forward under the impetus of prolonged peace, of divisions among our European foes, and of new markets in distant seas. Dismissing the memory of castles in Aquitaine, at last we went down to our proper element, the ocean. The riches forthcoming from our voyages broke down all barriers set up in former times against usury, enterprise, and competition, and capitalist society arose. By Elizabeth's death the most fertile land was enclosed in private ownership, stocks and shares were changing hands on the London exchange, syndicates were working mines and industries, joint-stock companies trading to the Persian Gulf, Canada, and the Baltic. Indeed, 1588, not 1688, is the deciding date for our purpose, for the modernizing of England proceeded much faster in the first than in the second century of the two before us, and the really creative work was finished before the Armada set out to destroy it. Once grant these conditions of Elizabethan England, and the decisions of the seventeenth

century follow in natural sequence. No censorship could dam this current of free opinion, no paternal Government curb the desire for wealth, no King force a policy on this intelligent and solid ruling class, no one structure of society (however excellent) comprehend a community so various and modern. Both Strafford and Cromwell, then, were pulling against wind and tide; irresistibly the stream moves on to its appointed outlet—the placid, orderly, and final Revolution of 1688.

The exploits, material and spiritual, of these two centuries must always be dear to Englishmen. In their span parliamentary government was settled, the predominance of the Commons won, and the Cabinet system planted. The Anglican Church and Protestant dissent each proved too mighty to destroy the other. Ireland was, for the first time, firmly linked to Britain, and the way prepared for union with Scotland. The spur of gain, religion, or adventure, sent London merchants, Devon yeomen, or East Anglian Puritans to every corner of the earth, and the Empire was founded in America, India, and Africa. The royal navy and the regular army each had a glorious baptism of fire. A new literature burst out in sudden and astonishing magnifi-

cence. Finally, while Europe ran with bloodshed in the name of religion, or of Hapsburg, Valois, and Vasa, England completed in virtual peace her revolution from medieval to modern times, and made such strides towards modern levels of civil freedom, that even the next great turmoil of 1789 could be surmounted, with easy and legitimate developments from the constant principles of our government.

The generations who commanded this success also deserved it. In an age of personal government, our rulers were often supremely excellent, and rarely ignoble. One hundred and seven years were covered by the great names of Henry VII, Henry VIII, and Elizabeth. Both James I and Charles II, though stained by varying vices, had more than usual ability, and each stimulated some of the chief causes of future prosperity. The crime of Charles I lay in his method, not in his ideals, some of which were noble, and nobly defended even to the scaffold. Oliver Cromwell, a plain country gentleman, closed a civil war, united three kingdoms, and hoisted the English flag high in Europe. But the citizens were greater than their rulers, and all that is most goodly in our heritage is due to the astonishing talent and force of Englishmen between 1550 and 1688. In politics, Burghley and Walsingham,

Strafford and Pym, Vane and Ireton, Clarendon and Monk, Shaftesbury and Halifax. In the Church, Cranmer, Parker, Jewel, Laud, Andrewes, Jeremy Taylor, the seven bishops; among the Dissenters, Cartwright, Penn, Baxter, Bunyan. For each name in literature, a score of equal genius are omitted, and one page of the mind can hardly contain Spenser and Shakespeare, Marlowe and Jonson, Donne and Marvell, Burton and Browne, Milton and Dryden. In the high altitudes of thought there are Hooker, Bacon, Selden, Hobbes, Wren, and Locke; on the steep ground of heroic action, or pure ideal, we may recall Sidney, Drake, Frobisher, Blake, Eliot, Falkland. Stronger still is the impression of sane ability and varied power to be gathered from records of average lives. We find a middle class ready to shoulder the burden of administering a modern state—ardent, like the Gilberts, to explore new continents—prepared, like Blake, equally to command a navy or defend a town. Raw recruits, trained by Oliver's officers and put in red coats, defeat Condé; fishermen cross the Atlantic in ten or twenty-ton boats to fight the Spaniard, or steer through icebergs to the promised North-West Passage; women stand sieges in manor-houses, boys the rack for their belief;

courtiers, weavers, old priests, meet the axe or enter the fire with a prayer for the State which thus tortures them. And the race which could furnish so many martyrs waged civil war with marvellous humanity, spent large sums upon charity and social welfare, and showed in the ordinary round of civil life an almost uniform moderation and good humour. True, there were faults, enough and to spare, in an age which at one end evoked the satire of More's *Utopia*, at the other the comedy of Congreve. It was superstitious, fiercely acquisitive, financially corrupt, unsparingly cruel to avowed enemies; men burned witches, imprisoned debtors and imbeciles in foul cells, oppressed their weaker neighbours, robbed the State, executed those who came within the remotest fringe of heresy or treason. But no age has been more crowded with personality and pure heroism.

In three vital respects it differed, even at its close, from our own. It was a rural age, and possession of land was the road to power. It was aristocratic, and gave short shrift to a theory or practice of equality. And it was an age of dogmatic religion; faith alone could move the large illiterate masses. Religion divided parties, coloured foreign policy, and gave a new fierce note to English patriotism :

"Verily," said Latimer, "He hath showed Himself the God of England."

Yet, taken all in all, few periods of history had better balance and poise. The aristocracy was not an eighteenth-century plutocracy, but still founded upon nature, service, and merit. The age is full of "new men" of the yeoman and shopkeeper class, who found fortunes and pass on higher; a great career was open to talent, and service to the State richly rewarded. Wealth was not unevenly distributed; the number of landowners still very large. Capitalism was a matter of many small masters; nor was the industrial fabric yet exposed to shocks from all quarters of the globe. England was not yet bisected into rural and industrial areas, industry was well distributed and linked to agriculture by a domestic system which made the peasant family half small holder, half industrialist. This balance, which obtained in society, seems to apply also to the national politics. The Reformation does not, as in some countries, cut every strand with the past; it does not founder, as elsewhere, in bloodshed or anarchy. The strong arm of the Tudors saved much of the Church's Catholic tradition, and maintained, as against Protestant individualism, the strong machine of the State. In Church and State alike a *via media* was, by

1688, well established; Anglo-Catholic and Protestant, prerogative and individual liberty, order and progress, the best of both halves of the world-order which the sixteenth century had riven asunder, were preserved for the future. It is only after 1660 that we begin to be conscious that in one grave particular the balance threatens to break down—that the defence of the poor, which all Governments till that date had made their care, is exposed to growing danger.

The people, who carved out for themselves so deep a niche of glory, and for their posterity so great a fortune, were few in number and limited in resource. Forty millions, perhaps, in our values, was the utmost revenue that could be raised in 1688; the population of England and Wales, which in 1485 was about four millions, was even now not more than five and a half, or one million, perhaps, of men of fighting age.

II

THE END OF THE MIDDLE AGES—1485-1527

THE year 1485 in itself begins nothing save a new dynasty. Identical dangers troubled both the "old" and the "new" Monarchy—pretenders, nobles, social revolution. To crush them, Henry VII merely elaborated the Lancastrian Star Chamber and the Yorkist Council in the North, and imitated that reliance on the middle classes, who had served Edward IV so well. Parliaments were still few and far between; revenue was constantly raised by judicial extortion and benevolences. If Henry VII followed the peace policy of his Beaufort ancestors, Henry VIII, like the Yorkists, tried to conquer in France. The Church still carried her head high, and four great prelates—Morton, Fox, Warham, and Wolsey—held for forty years chief place in the Council. It is only with the Reformation Parliament that a real beginning is made of the Tudors' characteristic achievements, of a national Church, parliamentary monarchy, and

British policy; and the immediate difference between this dynasty and their predecessors was one not of measures, but men.

The two Kings were themselves chief architects of their success. The father, at his accession twenty-eight years old, had shown nerve and restraint in adversity; when fortune smiled, he was merciful, prompt, and industrious. His own memoranda prove his attention to detail, his curiosity in new things and human character, his continuous but not sordid economy. His lungs were weak, and neither his physical nor moral traits made for popularity, but he was a great ruler. No one better appreciated that English interests lay in peace and the balance of power. His legislation, drafted for the most part under his own eye, was solid and bold. Fourteen years' exile in France had given him a liking for French ways of government, and he showed with advancing age the same blend of avarice and superstition as Louis XI. His religion, and other good qualities, may well have come from his mother, Lady Margaret Beaufort, who was only fourteen years his senior, and had twice as much influence upon him as his beautiful, colourless wife, Elizabeth of York.

When Henry VIII succeeded in 1509, being not quite eighteen, scholars and ambassadors

vied in his praise. Nature and art made him a royal manly figure—a mighty archer, jousting, and tennis player. He was proficient in Latin, French, and Italian, could compose an anthem, amend a confession of faith, draft telling state-papers, and reduce an audience to tears by virile, high-coloured eloquence. When this leonine figure grew to his full stature, he passed in strength every beast of the field, and few statesmen have shown greater capacity for growth. He began by squandering his father's treasure in reckless war and his own youth in noisy dalliance; he lived to drive a great mass of constructive policy through a doubting people, foreign foes, and hairbreadth danger. Of his vices more than enough must appear hereafter; in early days, when in the Renaissance to be young and unopposed was very heaven, they were barely suspected.

But the first task of these gifted Tudors called for arts more primitive than popularity: they had to avoid the fate of Richard III, whose naked body, slung over a horse, was carted away from Bosworth field. Sedition and contempt for law had become a habit with the nobility. The House of York had many offspring and wide-stretching roots. Its brain was Edward IV's sister Margaret, Duchess dowager of Burgundy; its chance lay in the

discord of England, the sympathy of Yorkist Ireland, and the wish of Scotland and Europe to embarrass the new King. The military leader of the first serious conspiracy was John de la Pole, son of Margaret's sister, Lady Suffolk. He was killed at Stoke, the battle which disposed of their tool, Lambert Simnel; but from Germany and the Netherlands his brothers Edmund and Richard long maintained the feud. The first, handed over in 1506 by the Archduke Philip, was executed by Henry VIII; Richard, "the White Rose," escaping all duns and assassins, died with the French army at Pavia.

Far more dangerous to the Tudors was the artistic plot which from 1492-99 circled round Perkin Warbeck, a boatman's son from Tournai. He, too, was exploited by Duchess Margaret, and coached in the English language and the rôle of Richard of York. Accepted for a season as a prince at Paris and Vienna, he once invaded England from Scotland with James IV, and once from Ireland to join the rebels of Cornwall. An effort to escape brought him to the block in 1499, and he dragged down with him Clarence's son, the innocent Warwick.

The treason of William Stanley, brother of the King's stepfather, Derby, proved the

(or Norfolk as he became later) the only peer high in authority. The backbone of government were ecclesiastics like Morton and Wolsey, commoners like Poynings or More, royal servants like Empson, Dudley, and Pace. Great reliance was, it is true, put on individuals like Northumberland or Henry VIII's brother-in-law Brandon, duke of Suffolk, but none on the nobles as a caste. The decisive step of the first Tudor session was to swear the legislature against livery, forcible interference with justice, and all other offences which had made the nobles notorious; an act of 1487 gave to a special committee the statutory powers formerly exercised against the over-mighty subject by the Council, on its judicial side in the Star Chamber. Far from setting up a new court, or limiting the Council's authority, the act merely continued the efforts of previous sovereigns, and formed a first instalment of many measures for strengthening the main-spring of the Government. Thus another statute of 1504 anticipated the later division between the political council in attendance on the King and the judicial section in Star Chamber, and Henry VII continued the Yorkist departments, which later blossomed into Councils for the North and the Marches, and

the Court of Requests for hearing poor suitors.

The first requisite for dealing with the aristocracy was this reorganized Council, acting without a jury, examining on oath or secret information, and representing the King's person, for whom a chair was always set in Star Chamber. The second need was strong finance. Royal grants made since 1455 were therefore resumed and, together with the lands of Lancaster and York and others from attainder, swelled the domain revenue to £100,000. The customs, and tonnage and poundage were granted for life. Rich men had to give loans and benevolences, and if Empson and Dudley, the past masters of such methods, were executed by Henry VIII, it did not discourage others, for Wolsey's exactions were just as severe. By such means, coupled with a liberal use of vacant bishoprics and feudal dues, Henry VII was able in one year to pay out £90,000 from his privy purse, and to leave his son a great fortune.

A third essential for internal peace was the restoration of local government. Here the first Tudor essayed the task which all his family were to follow—the winning of the country gentry to the Crown. He subjected the magistrates to his judges, armed them with drastic

were the vital market, and the ruin of English clothiers was the worst consequence of Burgundian patronage of Warbeck. Any political settlement with the Hapsburgs involved, therefore, making favourable provision for the Merchant Adventurers, and the delicacy of the interests at stake was seen in the friction arising out of the *Magnus Intercursus* of 1496, or the *Intercursus Malus* ten years later. Indeed, on the moot point of selling English cloth retail no satisfaction could be obtained. Commercially, England was still immature, as the power of the Hanse and other large alien colonies in London showed; the surest, though most troublesome, guarantee for future progress were those riots against foreign traders which taxed the efforts of the Tudor police.

The ramifications of the cloth trade, so sensitive abroad, necessitated close supervision at home. To balance it between Staple and Adventurers, or London and the provinces, was difficult, and its effects on agriculture menacing. Demand for raw material, demand for food, meant enclosure for pasture and for grain. The enclosing process, which had begun spontaneously a century before, now became ceaseless and high-handed; preambles of statutes, More and Colet, sermons and

ballads, bewail the eviction of sturdy tillers and archers for shepherds and silly sheep, the pulling down of hamlets, the swift creation of a vagrant proletariat. A mass of legislation and royal commissions failed to check landowners pursuing a course which trebled their profits, but if clothiers' and farmers' riches were proved alike by Customs revenue, statistics of building, and educational charities a bitter legacy in the soil was left to the next generation.

Other industries called for like assistance. Capital and labour, both breaking out of guild restrictions, were migrating to suburbs or country, to find freedom, raw material, charcoal or water power. Protection, or fiscal privileges, were given to industries that claimed to be "infant," languishing, or essential—to London silk-weavers, Norwich worsted-makers, or Bridport rope-manufacturers. Towards the wage-earner the policy anticipated, in main lines, that of the next century. The sin of idleness was the stock theme of the legislature, and the lot of the vagrant who would not, or the unemployed who could not, find work, was made deliberately unhappy. Statutes fixed maximum wages, and long minimum hours; unemployed were forced to accept work at the legal rate,

and breach of contract was punishable with imprisonment. On all sides Tudor law breathes the same conviction that, both for rich and poor, order was the first aim of society.

The previous century had proved the close connection of this order with peace abroad. Normally, English foreign policy continued medieval, until Reformation and oceanic-colonial rivalry brought in new motives; France was still "the ancient enemy" and trade with Flanders the ruling factor. What was new was the sudden competition of three great Powers in France, Spain, and the Empire, and the adjustment of this problem to England's vital interests. Peace was, doubtless, desirable for a new and shaky dynasty, but the conclusion that entire non-interference in Europe was the true policy, is as modern as it is facile. Popularity, if it does not condone a policy, explains it, and war with France was popular, not only with apprentices and ballad-singers, but with the martial classes. The Continent harboured many English rebels, and Scotland was the Continent's back-door. Nor was the ownership of the Channel and Atlantic ports immaterial, even in time of peace, for international law was in its barbarous infancy, and commercial jealousy

slid easily from tariffs to privateering. As for the balance of power, the scales had never been more heavily weighted, or more nicely poised, and the isolation deemed magnificent in a nineteenth-century Empire would have been precarious in the age of Machiavelli. Seen in this light, Henry VII's marriage projects, or Wolsey's kaleidoscopic treaties, represent what Bismarck called re-insurance, and had more purpose than at first appears.

Henry VII's only war shows the value he set upon peace. The occasion was the French threat to Brittany,—last survivor of French feudal fiefs, strong on the Channel, bound to Henry by ties of his exile. It was only when the war in a military sense was over, and when the marriage of the Breton duchess Anne with Charles VIII in 1491 destroyed its pretext, that Henry took his army to France, and disclosed the price he asked for a peace that he had no purpose of refusing. By the treaty of Etaples he obtained from France a large war indemnity, and a pledge to harbour no English rebels.

He used this war not only to make peace pay, but to win a lasting alliance with Spain, and this friendship remained the kernel of his system, as it did with his successors for nearly a century. The treaty provided for the marriage of Catharine of Aragon, daughter of

Ferdinand and Isabella, to Arthur, Prince of Wales, and long before these children grew up to be married, in 1501, the alliance proved its worth. For fortune favoured the Tudors, since in 1494 the long duel of France and Spain began for the mastery of Italy. From 1496 the marriage of Ferdinand's daughter Joanna to the Archduke Philip raised for France a terrifying phantom of encirclement by a Hapsburg-Spanish empire. Neutrality from England, at the lowest, thus became a prize worth winning; for this, Ferdinand would close the Continent to Warbeck and save his daughter's throne. His hand can be traced in Henry's reconciliation with Warbeck's patrons, in the *Magnus Intercursus*, and in the long-drawn plans for Anglo-Scottish peace.

Henry's Scottish policy was inspired by no vision of Union; merely by his usual cool temporizing. For real peace with Scotland was Utopian. The violent deaths of her Kings made constancy impossible; her nobles could be trusted for nothing but assassination, the Border could be inflamed by a few pounds well distributed. The Yorkists' capture of Berwick had deepened hatred for England, and bitter experience was to prove that only cordial relations with France could keep their Scottish clients quiet. The marriage at last

accomplished between Henry's daughter Margaret and James IV was, then, rather an expedient than a project of empire, and served only for ten years to postpone this recurring war.

Yet opportunism constantly repeated becomes statesmanship of a secondary order, and the peaceful remnant of Henry's reign was as skilfully conducted as it was lucky. His weight in the balance was increased by the death of Isabella of Castile, which separated Ferdinand from the Hapsburgs. In 1502 Arthur—the next year his mother—died, and the hands of the two Henries came into the market. Historians have seen a decay, mental and moral, in the intrigues respecting Catharine's dot, or inquiries for the King's remarriage with the twice-widowed Margaret, Regent of the Netherlands, or with the lunatic Joanna of Spain; the conclusion does not seem to be called for. The future of Europe, especially of Spain, was entirely uncertain. It were wise, then, to retain the possibility of Catharine's remarriage to Prince Henry, or to clinch it by Papal dispensation, but politic also to show, as by the Prince's signed protest against it, that England need not hurry her decision. If Spain collapsed, good relations with the Regent Margaret were essential; the

retail cloth trade, assigned to England by treaty, was the background to this elderly romance. Best of all was the sequel in the marriage by proxy (December 1508) of the King's daughter Mary to the Archduke Charles, heir prospective to Austria, Spain, and Burgundy. Till that was achieved, the hapless Catharine might be kept on short commons, and Ferdinand be left suspended over his abyss in Castile.

Far different was the early policy of Henry VIII, marked as it is by two wars and restless, gorgeous diplomacy. The King (so proud of his legs) bestrode the stage as mediator, defender of the faith, and potential Emperor; Wolsey, as far greater than any Pope. Of those who have judged this policy sterile or extravagant, some have cleared the King at the expense of the Cardinal, others the converse. It is, indeed, hardly possible to overdraw the influence in this period of Wolsey, the grazier's son, risen by way of an Oxford fellowship and Bishop Fox's favour to be Chancellor, Papal legate, and chief minister. The King was in his first popular beauty: it was hard to get at him amid jousting and junketing, music and reading. Business was therefore piled on the Cardinal, who in Star Chamber reproved the gentry and checked enclosure, in Chancery

and the Requests heard poor suitors, in Council prepared every detail of war and negotiation, in Parliament had to justify taxes and defend the Church. Yet Henry's early masterfulness in other branches is well established; his ambition to shine in Europe was coupled with personal jealousy of Francis I, and years after Wolsey's fall he engaged again in French warfare. The first of the series (1511-13) was due in part to an orthodox desire to defend a Pope menaced by French schism, in part to that wish for popularity which made him execute his father's agents, and again to promptings from Ferdinand and the Emperor Maximilian, each (in James I's phrase) "an old and experienced King." The Queen's influence (for so Catharine had become in accordance with Henry VII's last wishes) was naturally used to cement the Spanish alliance.

Prestige, nearly ruined in 1512, was restored in full measure the next year—in the Battle of the Spurs, the capture of Tournai, the destruction of the Scots and their King at Flodden. From this date till the second French war of 1521 a peace, armed and feverish, obtained in Europe.

Death swept off the old players. Louis XII made way for the more dangerous Francis, Ferdinand for the Archduke Charles, Maxi-

milian in 1519 for the same. At each stroke new uncertainty, new alliances. Wolsey's policy, avowed to foreign envoys and English councillors, was to keep the balance, to prevent the union of two powers against England, and ensure a share in all profits. Twice he countered the junction of the Hapsburgs with France by outbidding them at Paris: in 1514 marrying Henry's sister Mary to Louis XII, in 1518 pledging his daughter Mary to the Dauphin and selling Tournai back to France. But the election of Charles V to the Empire, making war between him and Francis certain, set a new and decisive test for this hitherto not inglorious English diplomacy. A modern eye could find a dozen reasons for non-intervention—in the state of the Church, of Ireland, or of the very balance of Europe. One common explanation, that Wolsey wanted Charles' assistance to be Pope, is ruled out by the logic of dates; history must, it seems, be content with the common popularity of the war, with the commercial value of Charles' friendship, with Henry's wish to pull his weight, and his sympathy with the Emperor like himself the opponent of Luther. For in 1521 the royal author produced his *Defence of the Sacraments*.

The war's military fruits were insignificant

invasion from Scotland was repulsed, but two raids into France were indecisive. In 1525 Charles crushed the French at Pavia, and Francis went to Madrid as a prisoner. Indefatigably, Wolsey set about redressing the balance which England had helped to overturn; again Mary's hand was pledged to a French prince and the Pope encouraged to resist Imperial aggression. But early in 1527 questions arose which threatened to destroy the Cardinal's symmetrical diplomacy. Henry's projected divorce would illegitimize Mary, the destined bride of France; it would, moreover, embarrass the Pope, whose capital was sacked in May by the Imperialists, and whose person was soon at the Emperor's mercy. Not only so; stormy scenes in Council and Parliament menaced the national accord, which for a generation the Tudors had maintained.

The friendly public opinion on which these despots without an army depended, was not expressed by parliamentary government. Six parliaments did, indeed, meet from 1485-97, but their sessions were brief, and one only was held between the last date and 1509. The next three sessions up to 1515 did little but grant war taxes, while from 1515 to 1523, as again from 1524-29, Parliament was not summoned at all.

and the wretchedness of the poor. Already the Commons in 1515 had betrayed their anxiety to attack Bishops and Church courts. The work of Colet, Dean of St. Paul's, founder of that school and interpreter of the Apostle, was sufficiently done; the Universities were resounding with the feud of the new Grecians and old "Trojans." The printing press was directing a stream of critical knowledge on to all things established. The earliest editions of printed Statutes appeared under the first Tudor "despot;" in 1520 an Oxford bookseller sold over 2000 printed books; already a "Christian Brotherhood" in London were distributing imported New Testaments. The old earth was passing away. Cabot's voyages from Bristol had brought news of strange western isles, Vasco da Gama had rounded the Cape, Eastern products were unsettling the Continental Bourses. Rome, mistress of the old world, was in 1527 ravaged by Lutheran mercenaries, the new barbarians.

As for England, the throne lacked an heir male; the King's Highness was beset by unsuccessful war, internal disorder, and trouble domestic. The classes and interests, which the Tudors had set out to satisfy, were once more tossing to and fro. It was time for new remedies, and for the Middle Ages to end.

CHAPTER III

HENRY VIII AND THE REFORMATION

THE last twenty years of Henry VIII form one of the irrevocable periods in English history; the foundations then laid still hold up modern society. The Church was violently torn from the Roman communion and jurisdiction. A new aristocracy replaced the monasteries. The English Bible created Puritanism, and sowed grain for democracy. Parliament at last became a familiar branch of government. Wales and Marches were reduced to something like uniformity with the standards of London. Ireland was at length subdued.

It is possible to be grateful for this solid achievement, without admiring its agents. The last half of Henry's reign is the very definition of tyranny, and the methods of his Reformation were sordid and inhuman. Over the whole process sprawls the great bulk of the King, changing every day further from that gracious Renaissance prince, who

had talked philosophy with More at Chelsea, and charmed all hearts by his gay vitality. No minister replaced Wolsey in concentrated power, and Henry's self-will extemporised its own law. From the inner chambers of his nature—strange compound of political insight, moral scruple, and animal desire—slowly unrolled that narrow *via media* along which all England must march. Deviation meant death to those who, "faint to God, faint to the truth, faint to His Highness," found some different clue to the maze of conscience and policy, or developed reservations of their own. Thomas More, though willing to obey a *de facto* succession, perished for silent disapproval of Henry's second marriage. Lack of beauty and political assets in Anne of Cleves doomed Cromwell. It became treason to express doubt of Henry's religious supremacy, treason for an unchaste woman to wed the Supreme Head. Catholics, who repudiated the succession, died alongside Lutherans who denied transubstantiation.

A murderous cynicism contaminated King and Court. Henry rejoiced in public at Catharine's death, and betrothed Jane Seymour on the morrow of Anne Boleyn's execution. Catharine Howard privately rehearsed her own tragedy, block and all. Abbots

were denounced and dragged to gibbets by their neighbours. Many individuals grew rich, but morals and religion poor indeed. And the moral tone, like every stage of this first reformation, was determined from the Court. No spontaneous enthusiasm can be traced in Parliament or people; the crime, as well as the achievement, is pre-eminently the King's. 'His hand's cunning in politics grew with experience and sole command, and the nation, less cowed than dumbfounded or corrupted, genuinely admired him. Against a black background we must set hard facts; that through such tribulation the whole Reformation world had to pass, that the bloodshed and destruction abroad were ten times more severe, that, if suffering and martyrdom were the seed, the final harvest was individual liberty and constitutional government.

This end was far, indeed, from the thoughts of Henry and his subjects, when in 1527 the Divorce first troubled Wolsey's peace; far from the cardinal's servant, Thomas Cromwell, whose will, drafted in these years, bequeathed his soul to the Virgin and legacies to London Franciscans. The Divorce project, originally unconnected with religion, sprang from a mixture of passion and policy.

Catharine's marriage, repellent to many from the first, had failed in all its objects. Of six children, only the eleven-year-old Mary survived, and the Spanish alliance by 1527 was broken down. Henry had long been unfaithful, and his illegitimate son, the boy Richmond, might provide one solution. But in 1520 Norfolk's nieces, the Boleyn sisters, caught the royal eye; Mary was for some years the reigning mistress, to be replaced about 1526 by Anne, whom, by the date of the sack of Rome, Henry was determined to marry. He cherished hopes of this reward for his services to the Holy See; he could point to dispensations given for his sister Mary's marriage to Suffolk, and for his sister Margaret's divorce from Angus, her second husband.

Two years were enough to dispel this dream. What was asked of Clement VII was considerable: to obliterate the solemn dispensation granted for Catharine's remarriage by Julius II, and to overlook the notorious intimacy of Henry with the elder Boleyn. If a Medici Pope could get over such matters of principle, the military situation made him, for practical purposes, an Imperial prisoner, and if in the scant days of French military success he could toy with notions of bigamy

for Henry, or a nunnery for Catharine, hard facts in the end kept him true to his office. For Catharine was unyielding, and in June 1529 the treaty of Cambrai put Italy and Papacy in the Emperor's hands. The commission to try the divorce, which had been committed to Wolsey and Cardinal Campeggio, was revoked in July, and in October Wolsey fell.

To him the divorce was sheer fatality. It destroyed the marriage planned between Mary and Orleans, as part of the French alliance; Anne Boleyn's candidature demolished his second plan of a French match for Henry; her hatred, with that of the Howards, poisoned Henry's mind. Desperately Wolsey lent himself to forward a scheme he had not approved, menaced Rome with schism, searched Campeggio's baggage for lacking documents, entreated France to save Clement in his own despite. Failure to meet Henry's wishes was unforgivable; fallen so low, Wolsey turned to duties long neglected and aspirations long cherished, visited his York diocese, and pushed on his Oxford college. His enemies would never have left him at peace; as it was, the wish to recover power led him into dangerous correspondence, and when in November 1530 he died at Leicester, he was going under

escort to the Tower. He had made England eminent, and given her domestic peace, but now he was useless; for Henry at the close of 1529 summoned Parliament, to redress "the enormities of the clergy."

In a campaign directed to forcing Rome into surrender, Henry could reckon on strong support. To large sections the Church officials and monks were detestable; in London, and in the coast shires trading with Europe, this anti-clericalism was rabid. Colet and the Renaissance leaders had firmly underlined the worldliness of prelates, and the slothful superstition of monks. Lollardy had never been extinguished, and the burning of a few heretics, and of many heretic books, continued till Lutheran literature was smuggled into London.

For this criticism of the Church there was ample warrant, for all the evils which had convulsed Germany flourished in England. There were too many clergy; the towns were full of young priests demoralised by freedom from duty save singing of chantry masses. They were deeply secularized, from absentee political bishops down to household chaplains, who kept the farm accounts or brewed the ale. Exemptions and laxity had ruined discipline. The moral standard was low;

the Cardinal had his illegitimate children, the Abbot of St. Albans his mistress, the grossness of priests and friars garnished quarter sessions. Monasticism was decayed. Few houses had been founded in the last century; many were half empty, many financially straitened. Some principal abbeys had won hatred as enclosers, some smaller ones were living in flagrant vice.

Two grievances touched the King and nation more nearly. The Church courts' power over clerks, or "benefit of clergy," had been cut down by recent legislation, but in 1515 a clerical effort was made to rescind the statute which deprived of such privilege murderers and robbers in minor orders. Wolsey tried to refer the question to Rome, but King, judges, and Parliament showed their teeth. Henry declared that he, like all English kings, had no earthly superior; the judges spoke of *praemunire*; Parliament was quickly dissolved. Even more irritating and persistent was Church jurisdiction over laymen in cases of probate, testament, tithe, libel, and other offences which, under the vague heading of morals, the clergy had contrived to keep from the common law. The fees of these courts were large, their methods inquisitorial, while behind them was the

appeal court at Rome. But to this hard and competitive age the money grievance most appealed. The clergy's endowed wealth was great, but they exacted vast additional sums from the people. Some went to Rome in annates (the first year's income of a benefice), Peter's pence, patronage for Italians, and judicial fees; but more to the Church at home. "The parson sheareth," wrote Tyn-dale, the translator of the New Testament; "the parish priest polleth, the friar scrapeth, and the pardoner pareth; we lack but a butcher to pull off the skin." For this they had not long to wait.

The memorable seven years of the Reformation Parliament divide at 1533, which marks the marriage of Henry with Anne, the breach with Rome, and the beginning of seven years of terror. Was the verdict of Parliament that of a free body? The Commons were "packed," in the sense that all sixteenth-century Commons were packed; a large number of royal servants had found seats, provided by direct pressure in the few constituencies which the Crown could influence, but far more by indirect pressure through the landowners, who returned most members. The Crown, as always, took the initiative; thus the Commons' "Supplication against

the clergy " was drafted in Cromwell's circle. Members' readiness to attack the money abuses need not be doubted; their wish to change the fabric, question the faith, or depart from Rome, is much more arguable. In 1529 Henry had to interrogate one committee in Star Chamber; in 1532 these curious reformers begged to be dissolved; the great Acts against annates and appeals were both opposed. In secular matters they contested Henry's wishes more ardently; they showed their dislike of making words constitute treason, and twice threw out the Statute of Uses which impaired their freedom of settling lands on whom they willed. But no politician save More, no bishop save Fisher of Rochester, was found to refuse the royal supremacy, and no member of the Commons suffered for his faith. The legislature were incited by appeals to national prejudice and private gain; as a body, most of them were ready to follow Henry's rearrangements of the succession; as individuals (and not least strong Catholics like Norfolk) they swallowed monastic lands. They would not initiate an attack on the Church, but neither would they defend it; only in this Laodicean sense can Henry's Reformation be described as a national revolt.

He entrusted the management of this cold

Parliament and this reluctant Church to two new advisers. The theological amenity and literary grace of Thomas Cranmer deeply impressed the succeeding twenty years. From a chaplaincy with the Boleyns and foreign embassies, he was chosen to follow Warham at Canterbury in 1532, and alone among leading councillors kept Henry's favour to the end. He was married to the niece of a German reformer, and was the first Englishman to view reform of the English Church as part of a great movement. He kept close contact with Reformers in all Europe, and adapted their liturgies to his own perfect English. In no servile sense, but as the vane exposed to the elements of heaven, he vibrated to every current in the intellectual air. If Cranmer imparted this faint spiritual glory to the Reformation, Thomas Cromwell personified its force, and only the austere historical canon could refuse him greatness. A self-made man, by his wits he built up a fortune as merchant and solicitor, transacted business for Wolsey but opposed his costly foreign policy, and at his fall swiftly found new patrons. His experience was worldly, his mind material and entirely modern. He was the earliest of those "Italianate" Englishmen whom contemporaries

thought the devil incarnate, owned books like Petrarch, and quoted Machiavelli. His knowledge of northern Europe was limited, and his foreign policy insular. He was corrupt and obsequious to the King, but had a notion of "the commonwealth" which resembled an ideal. Dogmatic religion meant little or nothing to him, and if in time he moved, faster than Henry liked, towards Protestantism, it was because the fire of hostility to the new State was kindled by Catholics. Like the greatest of his name, he was a man of action, and to him must be ascribed the parliamentary pressure, the ruthlessness, and the redoubled speed, of Reformation after 1533.

All done until that date was tentative, or preparatory. Neither the appeal to the universities of Europe, nor the Act against annates, involved a final breach. Legislation was pushed forward to whet the appetites of the laity and to intimidate the Church. In the session of 1529-30 statutes passed to fix fees, to limit pluralism, to check clergy engaging in trade. In 1531 the bludgeon of *Praemunire*, that had crushed Wolsey, descended on Convocation, which was made to recognize Henry as supreme Head, "so far as the law of Christ allows." In 1532 he

forced the clergy to accept three articles that meant total surrender; canons were henceforth to be made only with royal licence and approval, and a commission was to revise ecclesiastical law.

In spite of such blows at the clergy, embassies to the Pope at Bologna or to Catharine at Dunstable, in spite of the orthodox Henry proved by excluding Lutheran books, the doors he wished to open remained shut; if the promised heir to the throne was to be legitimate, he must break them down. His secret marriage to Anne in January 1533 was the first step towards what must end in open revolution. In February an Act was passed, forbidding appeals to Rome; in April Cranmer declared void Henry's first marriage; in September Elizabeth, eldest daughter of the Reformation, was born. Against foreign intervention Henry was assured by warfare between France and the Empire, and the year 1534 clinched all that had gone before. Annates were transferred to the Crown, all money payments cut off, the election of bishops made solely dependent on royal licence. The Act of Succession vested the inheritance in Anne's children; all subjects could be asked to admit that the first marriage had been invalid, and that the Pope had

violated the law of God. The Treason Act attached direst penalties to words, maliciously spoken, against the title or orthodoxy of the sovereign.

Catholic resistance, beginning even before Henry's new edifice was completed, in the oracles of the Nun of Kent found and exploited a channel for the general detestation of the King's marriage. The execution of this hysterical peasant and her accomplices did not seriously test Henry's resolve to drive the whole realm along his chosen road; but those of 1535 horrified England and Europe. It was a new outrage that Carthusian monks should be beheaded in their robes; how much more amazing the execution of Fisher, a bishop and Cardinal, and of More, ex-Chancellor and most famous of living Englishmen! Though neither would accept the Supremacy or the Succession oath, More had done nothing overt against them, while Fisher, though in touch with Spain, was old and dying. But Henry's effort to incriminate them earlier, his refusal to accept a jot of compromise, and the scandalous means used to secure their condemnation, show that he meant to spare none, however eminent or moderate. The issue was, in fact, come down to fundamentals; it was, as More declared, "against

one realm the consent of all Christendom for more than a thousand years." Henry had transformed the Church-state into an Erastian State-church, but in so doing he had changed the emphasis, not the substance of society. For a belief in the unity of the realm, in the junction of Church and State, and the sin of toleration, was common to all parties; those who had scattered Wycliffe's ashes and burned Hus had no logical ground for grievance. It is this which gives an inevitability to all Henry's proceedings; "by the law of the State," as many of his victims resignedly confessed, "they were justly to die."

The enforcement of this newly modelled, but old-principled, unity was committed in January 1535 to Cromwell as vicar-general, and six months later he began a visitation of the monasteries. In his mind this purpose had, no doubt, long existed. He had promised to make his master the richest king in Europe; the threatened vengeance of Catholic kings meant expensive armaments, and the Crown's fixed revenues were declining with the value of money. The monasteries' landed income was some £140,000, their lands perhaps an eighth of the cultivated area. Precedents for secularization or readjustment were plentiful. Henry V had reformed the Benedictines

and dissolved alien priories, Waynflete and Wolsey had broken up monasteries to form their colleges. The case for reform was equally strong. The monastic ideal was perishing; benefaction had long been flowing in other channels. One episcopal visitation after another had condemned grave immorality on paper, and condoned it by trivial punishment. In one sense, too, the road towards secularization had long been opened, for many houses had leased land to neighbouring gentry, who by acting as stewards, advocates, or recipients of corrodies, had acquired some vested interest in the estate.

Cromwell's visitation was no honest inquiry, but a search for material to justify a preconceived sentence; the low type of adventurers who were visitors did not see more than one-third of the houses, and inspected those they saw at the rate of twenty a fortnight. But the Aet of 1536 was moderate, in deference perhaps either to Cranmer and Latimer, who hoped to reform the monasteries into places of education, or to the squires, who in several cases opposed suppression. Dissolution was, for the moment, confined to houses with less than £200 a year, and they were some 350 in number.

The majority fell later, though by no

legislative process, for the Act of 1539 merely consecrated the facts. Their fall was part of the Crown's policy after 1537, consequent on the revelation of Catholic conspiracy on a European scale. The abbots of some, like Fountains or Glastonbury, were attainted; some had sold their goods, and could not pay their way; most could not pass the tight mesh of Cromwell's Injunctions. These and other iniquities added about 250 houses, and those the greatest, to the total. Some seven thousand monks and nuns were thrown into the jostling lay world; their tenants and dependants had to make what terms they could with new landlords, or swell the population of loafers in the towns. An orgy of loot—of land, lead, jewels, bells, and fish-ponds—in which courtiers, squires, and villagers combined, desolated the sites once filled with holiness and learning; in the rare habitations of the medieval mitred abbots, a new English aristocracy cheerfully laid the foundations of enduring homes. The money received by Henry's Court of Augmentations was larger than supposed, but his plans for re-edifying the Church dwindled down to six new bishoprics. To the Church the dissolution was more positively disastrous, for the money spent by monasteries on education now dried

up, and the new landlords took over their appropriated parish tithe. The rate of ordination dropped, ignorance and poverty dogged the Church till Laud's day, and the desert was filled by the advent of the Puritans.

Hitherto, Henry's Reformation had been purely destructive, but he was to find that his purpose of reforming without change of faith was an illusion. The first recognition of this came in the Ten Articles, the Bishops' book explaining them, and Cromwell's Injunctions. The Lutheranism of these documents was only an aroma: the Real Presence was still asserted, the seven sacraments retained, even images condemned only for abuse, and a delicate equilibrium kept between faith and good works. But the spark of dogmatic change was struck by orders for printing the English Bible, and for teaching Articles, Creed, and Commandments, to the people in their own tongue. Henry in person (all in white satin) could prove his orthodoxy by a death sentence on John Lambert for denying a Real Presence, but Lambert at the stake, crying "None but Christ," represented the future.

The fury of doctrine was to haunt Henry's last years, and all those of his children; his immediate task was to crush the last resist-

ance of the Catholic world. It broke out first in the Pilgrimage of Grace; in order of time, as in moral dignity, the northern peasants preceded Catholic nobles and European Powers. These Lincolnshire and Yorkshire rebels were not revolutionary, but fanatically conservative. They felt, as Norfolk felt who was sent to defeat them, that "it was never merry since the new learning came up." They asked restoration of the monasteries, dismissal of Cranmer, Cromwell, and the reforming bishops, repeal of Succession and Treason Acts, destruction of Tyndale's Bible, prevention of enclosure, freedom of elections, and a Parliament at York. Spreading from Lincoln across the Humber, the revolt enveloped the whole North, and half by fear, half willingly, swept nobles and gentry into a rising sprung from the masses. Their banner of the five Sacred Wounds covered the cause of the Catholic feudal North, against a heretic and centralizing State. But the last popular protest was also the noblest, for no democratic movement was ever less stained by crime, and Aske, the Yorkshire barrister who led it, was the purest figure of the age.

In 1537 Aske, Lord Darcy, and the abbot of Fountains, went with hundreds more to execution, and the new State survived its

greatest trial. Henry never faltered in his purpose of repression, but never was the Tudor star of good luck so resplendent. Paul III's effort to make peace between the Emperor and Francis was slow to succeed; his cardinal legate, Reginald Pole, was kept at arm's length by the rivals, each of whom hoped for English support or neutrality. It was only in the middle of 1538 that peace was achieved in Europe, only in December that Henry was excommunicated. Even then Catholic union proved an empty menace; Catharine of Aragon's death relieved her nephew Charles of an awkward obligation, Flemish commerce required peace with England, Turks and Lutherans occupied him on two sides. To the fulminations of Pole, the threats of invasion, and the linking up of English Catholicism with Europe, Ireland, and the Scots, Henry replied by destroying the old nobility, especially any whose claims could endanger his throne, and the grandsons of Edward IV and Clarence suffered for their blend of royal blood with lost causes. By 1540 the King stood triumphant. The birth of Edward VI (1537), which had killed his mother Jane Seymour, gave a new life to the dynasty.

But warnings of trouble, within and with-

out, had been sharp, and Henry, like all Tudors, reacted promptly to opinion. He delighted in popularity, but the Reformation, as personified in Cromwell, was loathed. He gloried in order; the new Bible preachers were upsetting society. His own orthodoxy was unshaken, and Catholicism in England was the first condition of non-intervention from abroad. The Six Articles of 1539 represent his own policy of reaction, and were vindicated in the Lords by his own royal mouth. They made denial of transubstantiation a heresy, and reaffirmed clerical celibacy, private masses, and confession. Their popularity proves that he had well gauged the average mind, the deprivation of Latimer for resisting them, that the fight of old and new creeds was really beginning.

But no submission could save Cromwell from Catholic hatred, and, luckily for them, he himself repeated in 1540 all those circumstances which had ruined Wolsey. Once more a minister, hated by the rest of the Council, embarrassed both the King's matrimonial relations and his scheme of foreign affairs. The marriage with Anne of Cleves was not the first time that Cromwell had pressed German alliances. The Duke of Cleves, in politics (though not in faith) a

Lutheran, was the arch-enemy of Charles V, and brother-in-law to the Saxon elector. Nothing but fear of a combined attack could have induced Henry to sign the treaty; within a few months he found himself married to a plain and uncultivated woman (who had hurriedly to be taught cards at Calais), and expected to shield her brother from the Emperor. The execution of Cromwell and the dissolution of this marriage were Henry's further steps to recover the *via media*: till the end of the reign his great ability was devoted to its maintenance. The "King's Book" of 1543 expounded the position of the Six Articles; the reading of the Bible was continued, but only for the propertied classes; the King's last will and testament itself halts between Catholic and Protestant language. In him the new unity seemed incarnate, and not over England only, but over a United Kingdom, that great shadow was spreading.

For the Reformation created the State by a concentration of powers. Disunity, which had hitherto been a passing phase or inevitable weakness, now became a matter of dear life; if a lukewarm bishop or a disloyal justice were dangerous, how much more a lawless Palatine or an enemy neighbouring kingdom. It is this which gives a certain

grandeur to Cromwell's machinations, or to Henry's bellicose decision that the whole realm must march together. One by one the old franchises were absorbed. An Act of 1536 vested in the Crown the palatinate courts of Durham, and Cheshire was given representation in Parliament. The statute of 1535, in finishing the anachronism of the Welsh Marches, completed the work of the Yorkist Council set up at Ludlow. Not Catholicism but anarchy was here the danger, and the Council of the Marches, under the resolute bishop Lee, mingled Erastianism and execution in due proportion.

Ireland was to prove a much more lasting difficulty, but here also Cromwell was the first minister to grasp the nettle. The conquest advocated by Norfolk, Henry's first Deputy, had been abandoned on grounds of expense, with the result of allowing the House of Kildare to oppress its rivals and create a chaos. Reformation made conquest a necessity. Irish emissaries began their long connection with England's enemies, and the seizure and execution of Kildare in 1535 was followed by the extension to Ireland of the Supreme Headship in all its details. This period of blood and iron was succeeded in 1541 by a lull in which the reign closed; a slow policy of Anglicanizing and civilizing

Irish chieftains was tried as an alternative to war.

If this left it uncertain whether Catholicism and racial pride would fuse in a solid mass against England, this unhappy result followed in Scotland as a direct consequence of Henry's aggression. The system of subsidizing a Scottish baronial faction, pursued by all the Tudors, inclined the Scottish King to France. Scottish Catholicism was gross but powerful, and had in Cardinal Beaton a resolute leader. James V's two French marriages were concluded against his uncle Henry's expressed wishes, and the war against France in 1544 was chiefly aimed at her ally. The capture of Boulogne was spectacular, but Henry hoped vainly to involve Charles and Francis in a wasting war, while he disposed of Scotland. As it was, he could only patch up a truce with France, and meantime alienated Scotland for a generation by making the marriage of their Princess Mary with his son the condition of peace, and by sending Hertford to waste Lothian and Edinburgh.

The last phase of Henry's policy was therefore aggressive, incomplete, and costly. The forced loans of 1544-5 were severe; debasement of the currency set a ruinous precedent, and redoubled the general wretchedness. Yet never had the King's prestige with his

people been so undoubted. Unitedly they rallied to resist any threatened invasion. Parliament gave him power to settle the Crown by will, and a free hand over heresy by proclamation. The Commons, packed by Cromwell, attainted their creator and allowed Henry to imprison their Speaker. Convocation with scandalous servility dissolved the marriage with Anne of Cleves. Norfolk, most powerful and accommodating of servants; at Henry's death was awaiting the execution already meted out to Surrey, his brilliant son.

This despotism, real as it was, was yet, as Raleigh said of Elizabeth's, "not Turk-like"; it was, rather, Cæsarism of genius, Buonapartism minus the army. By force of character, corruption, prestige, and terror, Henry created and courted the chameleon termed public opinion. He brought every marriage and doctrine to the bar of Parliament; there he reorganized his Household, set up his Court of Wards, and affirmed the powers of his various councils. By making the Commons act for forty years under his eye, he branded on a whole generation the majesty, unity, and empire of the State. But Phaeton could not ride unscathed the sun's chariot, and Henry by calling on opinion, even that of a restricted Parliament, was

asking a whirlwind to escort his safe, prudential reformation. The criticism he invited against Rome rent his own Council; the country was divided by two sects of extremists. In vain, agonizing with his ulcered leg, did he plead for unity, and deplore the wrangling of "that precious jewel, the Word of God," in every ale-house. Who but he had brought the Word down to the ale-house, or opened in Parliament the *arcana* of government?

No such reign as this, which closed with Henry's death in January 1547, had been seen since that of the first Edward. Edward had made government national, Henry by fusing Church and State made it omnipotent. With due allowance for times and seasons, their method was much the same; that all cards should be laid on the table made no difference to the rigour of their game. Henry, like Edward, was by instinct a despot, and like him left a country crippled by bad finance and beset by contradictions of policy.

St. Peter, says an old biographer of the Borgias, was told not to despise things unclean. It is hardly for Englishmen, who have inherited parliamentary liberties and Protestantism, to try in the scales the political genius and the monstrous iniquity of Henry VIII.

CHAPTER IV

THE DECIDING YEARS, 1547-61

THE blackest periods in English history appear to coincide with the maximum influence of foreign theories and foreign politicians. Edward VI and Mary reigned in such an age; German and Italian theology was followed by a ruinous stretch of Spanish power, and only Elizabeth restored the conservative insularity of her father's reformation.

There were good reasons for the darkness of Edward's reign. Sir Thomas Smith, one of Somerset's few friends and later Secretary to Elizabeth, insists in his account of the constitution that "the Prince is the life, the head, and the authority of all things that be done in the realm of England." But in 1547 Edward was only nine years old, and, precocious though his mind was, a sovereign who died at fifteen was necessarily ruled by others. The passions, therefore, which the strong Henry had restrained, found a vent, and England was carried towards civil war by two factions, keyed up by doctrinal

hatreds, anxious for power, hungry to exploit the quick profit which business men could make of "reformation." To survive in politics meant connivance; to win, almost necessitated crime. Treachery, timidity, and greed in various degrees marked the origin of the political houses—Howards, Russells, Herberts, or Cecils—who now set out to make or mar. Somerset, the sole idealist among them, was moral only in compartments, and his politics show a distasteful mixture of Somerset House and Exeter Hall. John Dudley, son of Henry VII's agent and father of Elizabeth's favourite Leicester, became under his new title of Northumberland the most daring criminal of the century.

But the best of governments would have been severely tested, for the sum total of human misery in England from 1540-70 defied speedy remedies. Part, no question, was directly due to bad administration. Henry VIII left one-fifth of alloy in his gold currency, and two-thirds in his silver; Northumberland raised the last proportion to three-quarters, and called the shilling down to sixpence. A ruinous policy of loans and inordinate speculation redoubled disturbance of prices. But the sharpest change of price levels in British history was mainly caused by economic

motives that were worldwide—revolutionary dislocation of markets and trade-routes, importations of bullion, and collapse of the medieval structure of industry. Profits, enclosures, and rents accelerated, but wages lagged behind. The Act of 1547, that destroyed the religious endowment of the guilds, removed another prop of the poor man's independence, as well as some funds for popular education; persistent fraud vitiated commerce. Worst of all was the harsh temper, which Latimer reproached in the Protestant laity. Resistance to Somersct's benevolent autocracy was intelligible, but the legislators treated Edward's proposals with the same contumely. They fixed penalties of treason on those who resisted enclosure, of felony on those who combined to lower prices, and literally branded the vagabond as "an enemy to the commonwealth."

The gap between the old order and the new was filled with the social misery and panic that accompanies revolutions. Woe to London, cried the preachers, the new Nineveh, where Christ and the poor lay uncared-for in the streets. Evangelical democracy raised its head, as it had in Germany; pamphlets advanced the rights of all for whom Christ had died.

Henry VIII's choice of councillors and tutors for his son marked a decision for further Protestant advance, but Somerset, the Protector chosen by the Council, allowed advance in a shape the King would have detested. The wish expressed by Parliament for "a lighter garment" was natural after the strain of the last ten years, but the repeal of Henry's heresy and treason laws *in toto*, of the Act of Proclamations and the Six Articles, gave radical reform a strong start, which the legislation of 1549 never caught up, and the absence of law left room for a popular, extra-legal, religious anarchy.

The mob dipped their handkerchiefs in Somerset's blood on the scaffold and treasured his memory, for his sympathy with the oppressed and his dreams of liberty were sincere. But the social reformer must either be Cæsar, or above suspicion; he, on the contrary, depended on a fluctuating Council, and criticism could find a dozen weak points in his armour. He took Maiden Bradley and much monastic wealth, built Somerset House from proceeds of churches and chantries, and set up an illegal court. A stigma, natural if unjustified, attached to him for the execution of his brother, Thomas Seymour, a villain who aspired to the hand of Princess

Elizabeth, dabbled in piracy, and conspired against the State.

Armed with little but good intentions, the Protector had to meet forces which demanded the strength and prestige of a Cromwell. His religious settlement followed the lines indicated by Henry, and later approved by Elizabeth. Abolition of clerical celibacy, grant of communion in two kinds, and services in English, prepared the way for the Act of Uniformity and Prayer book of 1549. From this the Catholics in Parliament were strong enough to exclude Cranmer's drastic reform of the Sacrament, and the Real Presence was retained. No compulsion to uniformity was put upon laymen, and the Princess Mary was allowed her Mass.

But Somerset's aspirations for religious peace were soon thwarted. The Catholic leader, Bishop Gardiner of Winchester, refused all compromise and was imprisoned. Rebellion in Cornwall and Devon (January to September, 1549) demanded restoration of the Mass and the Six Articles, and recall of Cardinal Pole. On the other side, a torrent of foreign teachers, illustrious and obscure, poured out the full Protestant programme in London and the Universities. The pure faith, suppressed by Charles V.

abroad, sought refuge in England, which for ten years was whirled round in the diurnal course of the European Reformation. The Pole, John a Lasco, was laying hands on godly elders in Austin Friars, Italian Peter Martyr was in command at Oxford, German Bucer at Cambridge, a Strasburg congregation in the holy valley of Glastonbury. One may reasonably doubt the lasting influence of Stumphius or Unterhovieus upon Anglicanism, but at the time it was profound, and militant Protestants took orders not from Canterbury or Whitehall, but from the masterful Popes of Zurich and Geneva.

East Anglian Protestantism of this sort laid its foundations in 1549 in social revolution. Somerset's sympathy with victims of enclosure was notorious, and the commission he issued to check it had for its leading spirit John Hales, who had vainly sought a remedy from Parliament. The gentry offered a solid passive resistance to the commissioners, and the whole South was disturbed by agrarian trouble; in Norfolk, under the rich yeoman Ket, the peasants captured Norwich and routed one royal army.

While the Western rebels had no social demand but limitation of gentlemen's servants, the Easterners hoped to abolish private

property. But both risings were quickly suppressed; not by Somerset, but by his rivals Northumberland and Russell, not wholly by English troops, but German and Italian mercenaries.

These English divisions, which Somerset was unable or unwilling to mend, were enough to dispose of his foreign policy. By defeating the Scots at Pinkie, he seemed at first to have crowned Henry's campaigns, and he spoke ardently of a union of hearts between the Kingdoms. But force only revived Scottish patriotism; their young Queen Mary was hurried to France, and under cover of the English troubles Henry II laid siege to Boulogne. The fall of Somerset at the end of 1549 was the certain result of his virtues and his weakness, and it was enforced by men of both religions; his execution two years later was brought about by Northumberland alone, whose path to power was barred by Somerset's popularity and scruples. So did weak good intentions make their invariable room for crime.

Northumberland's first exploit was an ignominious peace with France, by which England surrendered Boulogne and abandoned hopes of directing Scotland. Representing no popular interest, for no man had

punished rebels more severely, and no religious sincerity, for this Protestant politician swore on the scaffold to his Catholicism, he had no chance of backing, financial or otherwise, from a Parliament, the meeting of which he postponed till his greatest design made it inevitable. But money he must have to content his faction, and money was best forthcoming by posing as the Moses of Reformation. He proceeded, then, to break up the Catholic group who had helped him against Somerset; Bishops Gardiner, Bonner, and Tunstall were deprived, the crafty Paget disgraced, and Mary's household scattered. The spoils oozed out to the ruling clique; the bishoprics of Durham and Gloucester were "suppressed," church plate seized, and chantry lands sold. Meanwhile the Church was tumbling into ruins. New bishops like Hooper or Ridley refused to admit a Real Presence or wear the surplice, altars were turned into tables, scandals over clerical marriages and clerical ignorance demoralized many parishes. Foreign immigrants were only united in disobeying the law, and every heresy that had cursed the first four centuries of Christendom afflicted the country from which Henry VIII had banned "diversity of opinions."

The second "settlement" of the reign was duly signalized in 1552 by a second Prayer-book and Act of Uniformity. This time it was root and branch. The vestments authorized in 1549 were abolished; the altar dwindled to a table; the negation of a Real Presence was emphasized by a special rubric, added at the instance of John Knox, one of Northumberland's bishops-designate. Cranmer's essentially un-catholic mind embarked on a reformation of Canon law, which contemplated a semi-presbyterian scheme of synods: a third offence against the Act of Uniformity was made punishable with life imprisonment. Passive resistance to this violence, and fierce debates in Parliament, showed the probability of reaction, which was assured by national misery and Northumberland's crimes. On the first, it is enough to say that, while millions of money were paid out to the Duke's followers, all that was done for the masses was the organization of cavalry to repress them.

And now, for the first of two occasions in this period, the most powerful politician in England manufactured a scheme to alter the legal succession. But Shaftesbury's Exclusion Bill of 1680 was venial compared with Northumberland's project, which involved

intimidation of Parliament and forgery of the King's hand. Edward's remaining papers prove that he could recognize his subjects' sufferings, but in him, as in Mary, religious bigotry blinded a strong sense. On this chord Northumberland had played, but harp he never so wisely, he could not keep alive a consumptive King. Hence the desperate plot to win the Crown for one of the Protestant Greys, granddaughters of Henry VIII's sister, the Duchess of Suffolk, who were postponed by his will to Mary and Elizabeth; hence the marriage of Guilford Dudley to Lady Jane Grey, the student of Plato and all things of good report, innocent victim, in her sixteenth year, of the Reformation at its vilest. The King's death demolished a scheme which demanded repudiation of Henry's will, of an Act of Parliament, of two heirs, and which Council and judges had only accepted under force. The aristocracy, so long excluded from power, asserted themselves, and in three weeks saved hereditary monarchy. Edward died on the 6th July; on the 3rd August Mary entered London in triumph. The last Catholic reaction had begun.

For Catholic to some extent it was. Sir Thomas Wyatt raised the Protestant standard in Kent, but the Londoners' apathy and

Mary's courage settled the issue. The reversal of Edward's Church legislation created no difficulty, and ten of his bishops continued in office. But one year was long enough to show that the restored Catholicism was that of Henry VIII, not Henry VII. If two-thirds at least of Mary's parish priests later accepted Elizabeth's settlement, their Catholicism was clearly more Anglican than Papal. The veteran advisers now readmitted to Council—Norfolk, Gardiner, or Paget—had, after all, accepted Henry's breach with Rome. The Queen's second Parliament refused to disinherit Elizabeth; lay peers, led by Paget, rejected a bill to revive heresy laws; a third Parliament, which made this concession, was careful (packed though it was) to protect holders of monastic estates by terrors of *praemunire*. Yorkshire might still be Catholic, but London, the centre of government and trade, was vociferously Protestant.

Mary's easy accession, then, though in part a protest against Reformation in advance of public opinion, was much more reaction against sordid adventurers and bad government, the act of a people loyal to hereditary succession and conservative in change. In this view experienced politicians of all schools agreed, and the Spaniards, who in their own

states persecuted relentlessly, urged moderation on the English Queen.

But Mary, who might have won a fair hearing for her faith in a favourable atmosphere, ruined her popularity by marrying the Spaniard Philip. Loyalty to the memory of her Spanish mother, devotion to the Church she had never abandoned, and reverence for her cousin the Emperor, were rooted in her, and now at the age of thirty-seven, worn and embittered by harsh treatment at Protestant hands, to these loyalties she dedicated her life. The marriage was her own device; both Gardiner and Pole opposed it. National pride, maritime jealousy, and religious fears, made common cause; her first Parliament had asked her to marry an Englishman, and when her marriage, hedged about by many legislative safeguards, was accomplished, men's eyes turned to young Courtenay of Devon, or to Elizabeth.

Its effects justified these forebodings. Philip's efforts to make Englishmen swallow Spanish pensions, and himself swallow English beer, did not mellow the situation. To his fury, Parliament declined to crown him, and he revenged himself on Mary by absence and infidelity. The son, for whom all was prepared, never came to console her, and, lastly,

Spain dragged her into war with France and conflict with Rome. Pope Paul IV's vendetta against Philip and Pole left England cold; not so, the neglect of English interests in Scotland, commercial opposition from Flanders, forced loans, base coinage, and in January 1558 the inglorious loss of Calais. England was a victim to Hapsburg-Valois rivalry; behind the conspiracies of Wyatt, Courtenay, and Stafford, Henry II and his alert envoy Noailles were pushing French penetration and the pretensions of Mary, Queen of Scots.

If Mary made national resistance probable by accepting Spanish dictation in politics, she ensured it by ignoring Spanish advice in religion. The packed Parliament of 1554 restored the Lancastrian heresy laws and repealed the whole anti-Papal legislation of Henry VIII. Reginald Pole, the twenty years' exile, was brought back to preside, as legate and archbishop, over the revival of the old cause, for which his family had died. Though a liberal by Roman standards, he was bent on suppressing heresy, and to him and the Queen personally—not to Spain, nor to Gardiner, who died in 1555—responsibility must be given for the burnings.

Measured by Spanish examples the number

was small, about 800 in less than four years, but the *auto da fe* had not been seen in England on that scale, and all evidence shows the execration they evoked. The victims, generally, were drawn from two classes: the leading Protestant divines who had not fled into exile, and humble villagers, including sixty women. Of the total over one-third came from Bonner's diocese of London; Lincoln and East Anglia had many, the North and the West not ten between them. The two Englands, that asked such different forms of government and were so often to fight again in rival camps, were now divided by religion.

Four leaders of Edwardian Protestantism—Cranmer, Latimer, Hooper and Ridley—headed this army of martyrs, but neither this, nor the faster rate of execution as the reign went on, produced any genuine Catholic revival. The middle of the century was a close time for English religion and political energy; the exile of many active spirits, the connivance of others at practices they disliked, dulled resistance in Parliament and aspiration in literature. Bowing in the house of Rimmon, the nation sullenly waited for the Queen's death. It came, and Pole's also, on the 17th November, 1558; a week later

Elizabeth came to London from Hatfield, with Cecil, its future owner, in command.

Her reign was to last forty-five years; Cecil was for forty to be chief minister; but their decisive measures were taken within eighteen months, and Queen and minister were never greater. The crisis was immediate. Tortuous negotiations at Cateau Cambrésis were ending the French war, but a worse thing might come out of them than the final loss of Calais—a Franco-Spanish alliance. Within a few months Henry II's death made Mary Queen of Scots, Queen of France also, with a weak husband dominated by her Guise uncles. Her gallant mother, Mary of Guise, held out against Protestant rebels in Edinburgh, and the Catholic north of England was counting on Franco-Scottish invasion. Any religious decision would involve risk; the wrong one would mean rebellion. The Catholics were solid in the Bishops' bench, the Peers, and the Council. Mary had left a large debt and an empty treasury; 14 per cent. was being paid on loans at Antwerp; the forces were mutinous, the ordnance non-existent.

To gain time to breathe was the first necessity for this sick commonwealth; but the endless vacillations, that Cecil's game implied, blind us to the cold decision of these

first years. "Protestant" in some sense, the new settlement was bound to be. Elizabeth's sympathies had been undisguised during Mary's reign; the Papal cause was bound up with Spanish alliance, misery, and humiliation. The new Queen was decided to model her policy on her father's, the survivors of whose Council, conservative though they were, like Petre or Arundel, had fully accepted royal supremacy. Her inclinations were promptly shown in the use of English and a mangled Mass in her chapel, but hesitation was banished by the sentiments of the Commons elected in January 1559, who proposed to revive the title of Supreme Head, the second Prayer-book, and second Act of Uniformity. The lines of doctrine, blurred under Henry VIII, were hardening; if most of the Commons were really Protestant, the mass of the bishops and peerage were as staunchly Catholic. Bills for Supremacy and Uniformity were opposed in the Lords, and Convocation would not hear of compromise, while the need of humouring Catholic Europe was at least as great as that of reassuring Catholic England. The Government therefore decided to ask for less than the Commons desired.

By the Act of Supremacy Elizabeth took the less provocative title of Supreme Governor,

and admitted Convocation's right of assent to definition of heresy. Her Act of Uniformity, while restoring Edward's second Prayer-book, amended it in a manner that made it at most Lutheran, and conceivably Catholic. The Real Presence was not repudiated, and might be read into the Communion; the clerical dress was to be as in Edward's second year. Royal Injunctions did, indeed, impugn superstitious practices, but they subjected clerical marriage to the bishops' license and contradicted the Puritan idea of the Sabbath. The Church was, then, put on a basis which could be represented as not un-Catholic, and as merely continuing Henry's system. Yet in essence the new settlement was revolutionary. Save for a small body of official divines, the clergy's chosen representatives opposed it, and had no share in making the Prayer-book. One only of Mary's bishops continued, and twenty-five sees had to be filled in 1559-60.

This settlement of English religion was directly connected with foreign policy; for the equilibrium of opinion, which enabled Elizabeth to balance Catholic and reformer, was matched by that external equilibrium between France and Spain, which was to give her thirty years of immunity from serious war. The lasting conditions of English

success were already present; none the less, the decision to be taken was a grave one. By the Peace of Cateau Cambrésis France kept Calais, and to this the English were resigned. It was from the captor of Calais that danger threatened, and the Duke of Guise and his house reached their full ascendancy in July 1559, on the death of Henry II. But in this very spring the national, religious, and class feelings of the Scottish nobles flared up against a French Catholic despotism, and the Lords of the Congregation, with John Knox beside them, appealed to the English Government.

With cautious audacity Elizabeth and Cecil, disregarding most of the Council, determined to take this chance of evicting France from Britain and of crippling the Catholic claimant to England. They saw that they could make Philip politically Protestant, for he would give up many Masses rather than see the French master Edinburgh. Screened by the same fear on Philip's part, they had been able to make their religious settlement in security. Elizabeth courteously declined Philip's hand and disregarded his envoy's religious pleadings, but humoured him by the amount of Catholicism she retained, or suggestions of her marriage with a Hapsburg. The imperial votaress would even

confide her longing for a nunnery or, by lighting an extra candle on her chapel altar, rouse joy at Madrid over the sinner that repented. It was Philip, then, who begged Rome to withhold her excommunication, and resignedly accepted the advice of his ministers, that the one fatal disaster would be a French victory in Scotland.

But Catholic states were not only dis-united; they were, as Cecil discovered, limited in resource. Civil war was breaking out in France, while Philip had left rebellious Netherlands to find a troubled Mediterranean. Step by step, adjusting religion at London to the last news from Huguenot Normandy or discontented Brussels, Elizabeth took the plunge of helping the Scots' Protestant rebellion. First money; then Winter's fleet in the Forth; last, an army over the Border. Mary of Guise, abandoned to her fate, died in June 1560, and on July 6th the Treaty of Edinburgh rewarded political courage. The French troops left Scotland; the nobles, bound to England by alliance, obtained a share in the regency that waited the arrival of their Queen.

Best of all, from Elizabeth's point of view, was the inexpensiveness of her triumph, and the restoration of national finance was the third department, in which prompt action

stabilized the future. The issue of debased silver was stopped, its value called down by proclamation. In 1560 Government called in the whole mass minted since 1543, and in the space of a year completed the operation of a new issue. Strict economy, re-grant of first-fruits to the Crown, and a good deal of land-grabbing at the Church's expense, reduced the deficit. The coinage controversy had justified "Gresham's law," and Gresham himself was employed to deal with foreign manipulation of the exchanges. By good management and confidence, the interest on Government loans was reduced to 10 per cent., the total debt dropping from £279,000 in 1560 to £17,000 five years after.

Thanks, then, to the Providence whom the deist Elizabeth ever acknowledged, whose chief agent hitherto was the reluctant King of Spain, the Elizabethan Government won its respite for consolidation. No bloodshed had yet stained this revolution, and the impunity of Bonner and Paget is the clearest condemnation of Henry VIII's barbarity. Such peace was too good to last. Elizabeth was unmarried, and her health in these days uncertain. In August 1561 Mary Queen of Scots, the face that was to launch a thousand ships, crossed from France and reached Holyrood

CHAPTER V

THE ELIZABETHAN AGE

ROUND everything great in history arises an aura of legend often as potent as the original. As with Magna Carta or Napoleon, so it was with Elizabeth. The Virgin Queen, surrounded by Burghley and Sidney, Drake and Raleigh, the Gloriana of the poets, the hammer of Spaniard and Rome, is stamped irretrievably on the English mind, and raised in history, like the throne, above party. To her all the next century appealed. To restore the national equilibrium, that she maintained, was the ideal of Clarendon and Bolingbroke. The Protector invoked her when he re-opened war with Spain—"Queen Elizabeth of happy memory, we need not be ashamed to call her so." Bacon and Coke, apprenticed in her reign, handed on to the next the twin traditions of State and Common Law; Hobbes perpetuates her association of sovereign and people in one body politic. The Church, in Hooker's person, admitted in her its second

founder; "by the grace of God and His servant Elizabeth we are." In any case, neither facts nor legend give countenance to that view of her reign which would substitute economic mechanism for human will.

But the least "Elizabethan" figure of the age was Elizabeth, who distrusted enthusiasm and poured cold douches of caution and economy on her men of action. The great achievements, or institutions, for which she is famous, were wrought in her despite, save only the Anglican Church, which in its pre-Reformation type, its reservations, and its political temperament, incorporates more of her attitude to life than either democracy or Empire.

Opportunism, which was her second nature, became for her country a saving merit. Dogmatic pronouncements on religion, her marriage, or the succession, might plainly have caused civil war; premature alliance with Huguenots or Dutch would have precipitated invasion. History cannot pronounce decisively on problems the secret of which defied Cecil and Walsingham. It is plausible to assume that she had no religion and never meant to marry, that she was incapable alike of spiritual leanings, or of bearing children; it is more important that she used these

mysteries with unfailing insight, baffling both Europe and England by secret diplomacy or brazen flirtation. Her strictly political gifts were a curious blend between those of Henry VII and Henry VIII. The parsimony of the first in her ran riot. Her relations with Scotland and Holland were ever endangered by it; even in the Armada year she was selling muskets to her ill-paid soldiers. She had Henry VIII's royal way with people and Parliament—girding them to loyal passion, silencing their dearest wishes with the Crown's majesty, anon retreating in a cloud of sonorous concession. She shared, too, his royal temper, and would fly into tantrums over an unfavourable despatch, or beer she did not like, or the marriage of her favourite. As with him, her affections embarrassed without ruling policy. To the whims or graces of Leicester or Essex she would mortgage Cabinet harmony, revenues, reputation, but not power, and if Machiavelli's test be sound, to judge the sovereign by the ministers, she ranks high.

Nothing is more indicative of her settled purpose than the immediate choice of Cecil to manage the State, and Parker the Church. Like herself, both had kept silence in Mary's time; both were moderate, slow-moving, and incorrupt. Cecil, long ago Somerset's seere-

tary and since manager of Elizabeth's private finances, belonged to that English school of *politiques*—Selden, Clarendon, Halifax, and Harley—who have done most for the continuous life of the nation. His policy, habits, and tastes, were all substantial and safe. He was interested in landed property, shared in industrial combines, studied genealogy and family history. Trade seemed to him the country's life-blood, and a settled reason against war. He was less insular than his countrymen, and far more Protestant than his mistress, but in all things recognized that accommodation is the salt of politics. He dealt with problems as they arose, deducing from the innumerable pros and cons, which sprinkle his huge correspondence, a reasoned path of safety.

The Archbishop had been Anne Boleyn's chaplain and Bucer's friend, and save for his marriage was all that Elizabeth could desire. His learning was great, and the learned world's debt to him lasting, for he saved from oblivion the old English Chronicles. His theological "mediocrity" was sincere, and he supported unswervingly the royal policy of comprehension. He shared, too, his mistress's conviction that a political menace was implicit in democratic Protestantism.

Two factions endangered the Cecilian position. The one, which disappeared with the crisis of 1569-71, came from the Catholic and feudal influences represented by Norfolk, Westmorland, and the surviving magnates. More constant was the personal factor of the favourites, Robert Dudley, Earl of Leicester, and his stepson Robert Devereux, Earl of Essex. But scandals like the death of Amy Robsart damaged Leicester, while Essex's popularity shipwrecked on military failure and insane egoism. From 1571, when Cecil became Lord Burghley, he and after him his son Robert, a handy pocket edition of his father, retained in fair security the substance of power.

Elizabeth's Council must be judged as a whole, and Anne Boleyn's daughter formed the heart of it from the bourgeois Protestant aristocracy whom she represented, particularly from her kinsfolk among them. Hunsdon, Mary Boleyn's son, was Lord Chamberlain and the warden of the Border; his brother-in-law, Knollys, had great authority; Walsingham, Secretary from 1573-90, was stepson to another Carey; the Admiral, Howard of Effingham, husband to a third; Walsingham's brother-in-law Mildmay, Chancellor of the Exchequer; another cousin of

the Boleyns, the cultivated Buckhurst, succeeded Burghley as Treasurer. No prelate sat in this body of new talent, and no peer of pre-Tudor creation: was not Burghley the grandson of a yeoman in Henry VII's Chamber? Among other leaders, Sadler served Elizabeth in Scotland as he had Henry VIII; Smith, who followed Cecil as Secretary, had been the same to Somerset; Crofts (like the Careys) had conspired against Mary. Add that Walsingham, Knollys, and Mildmay were Puritans, and it is plain that Elizabeth knew the true basis of her throne.

The bitter factions that distracted this Council were not merely due to lust for power, or the immorality which smirched the Virgin's court. They fed, rather, on the baffling intermixture of three problems, each enough to test any ability and patriotism—the succession, religion, and foreign affairs. All three met in Mary Queen of Scots, behind whom might at any moment be ranged Scottish nationality, English Catholicism, and the whole fury of the Counter Reformation, directed from Rome, Paris, and Madrid. Providence, human frailty, and statesmanship, were to decree that these four corners of the world never came upon England simultaneously, and this knowledge makes us

unjust to Elizabeth. The certainty that Spain and France would not trust each other to settle England upon Mary, the inevitability of war, the Armada's revelation of the clouts that stuffed the Spanish colossus—from these spring impatient surprise that, years earlier, the Queen did not follow the road pointed by the Protestant war party, take up the cause of Christ against Belial, combine Puritans, Dutch and Huguenots in a holy war, and execute Mary, daughter of the Amalekites.

The Queen's miserliness or her hatred of assisting rebel Calvinists did, doubtless, assist to postpone much that in modern eyes glorifies her reign, but solid reasons for delay were overwhelming. To recognize a successor in 1560 or 1570 would have been her winding-sheet, for neither Council, Parliament, nor people were agreed. The Commons of these years vociferated in favour of Catherine Grey, Lady Jane's sister. But Henry VIII's will, that supported Greys against Stuarts, was itself questioned; Catherine's secret marriage to Somerset's son Hertford discredited her; and her death in 1568 left the field clear for Mary, candidate of aristocratic England. Catholic differences were buried in Mary's marriage with her cousin Darnley, and the birth of

James I in 1566 provided the heir longed for by patriots in both kingdoms.

The murder of Darnley, the Bothwell scandal, Mary's eviction from Scotland and her arrival as an English prisoner, did not eliminate her claim, nor diminish the danger. Elizabeth herself long wavered; definite breach with Mary might jeopardize all that slow use of time would solve. The reaction, which might have been predicted from the Elizabethan settlement, flamed out at Mary's presence, and from 1569 Elizabeth and Cecil were fighting the majority in Council, Catholic and Protestant, who hoped to overthrow the chief minister, the Reformation, and the new State, through the marriage of Mary to Norfolk. That year the Catholic North, resentful of its lost faith and franchises, of *parvenus* in office, moneyed men, and strong government, pushed Northumberland and Westmoreland, the Northern earls, into rebellion. In 1570, too late to save the earls from defeat and exile, or the North from punitive executions, Pius V excommunicated the Queen as a Calvinist, inviting her subjects and Europe to depose her. The Ridolfi plot of 1571 revealed the willingness of Spain and Mary to obey this summons, even by assassination, and the treason of half the English Council. Norfolk,

their stalking horse, died next year on the block; well might Elizabeth dally with warrants and reprieves, for the execution signalized a break with old England and the elimination of Mary from the succession. It stirred, too, the wave of anti-Catholic legislation which rose later to such savage detail, and accounted by 1603 for the death of hard on two hundred priests and laymen. Catholicism for three generations became identified with treason, and Elizabeth, not of her own volition, was placed at the head of Protestant Europe.

But religion never determined Elizabethan policy, and her change of alliances was accomplished by slow degrees. Having burned her fingers in one religious enterprise, the aid sent to the Huguenots in 1563, she realized that only the French Government could assist her in serious war with Spain. But against that war both economy and the vital Flanders trade, which took eighty per cent. of English cloth, protested, while French politics offered no guaranteed support. Catholic victory in the religious wars of France seemed likely after St. Bartholomew's, in 1572, or Henry III's military ambition might give much more help than Philip to a captive queen-dowager of France; the Government of to-

day might vanish in some new turn of the kaleidoscope, as Catherine de Medici struggled to retain power and her son's affection.

Nor did the revolution against Spain in the Netherlands from 1567 afford an easy field for intervention. Annexation of harbours in Zealand would cost much money. Alva, and Parma after him, were great generals with trained armies. To join France in a Netherlands war, as Coligni suggested in 1570 and Anjou in 1580, might mean a worse thing than Spain: the French in occupation of Antwerp, "a pistol pointed at the heart of England." Finally, open war would rouse the Catholic conspirators crushed in 1571, and tempt the factions surrounding young James to rescue his mother.

The policy adopted, therefore, was to make war on the big scale unlikely by erecting it, on a small indirect scale, into a system; to fill the fire so full with irons that conflagration would be impossible. Treasure on its way to Philip was seized at Southampton, the Devon gentlemen pirates were let loose on the Spanish Main, the Dutch subsidized (but never to excess). The *Politique* section of French nobles were flattered by the marriage prospects dangled before Anjou, the heir, and stimulated in their historical antagonism to

Spain. Scotland was kept in leash by maintaining alliance with the Protestant chieftains; when Moray was assassinated, Morton was patronized as regent; when French influence threatened in 1582, the Raid of Ruthven "rescued" the young king. The Huguenots received arms, money, volunteers, but not alliance. The German Calvinists were urged to save true religion in France. The Palatine princes were brought to the Low Countries to bridle the French. Till something turned up, Mary was to be kept alive; her death would force a door which sooner or later would be unlocked from inside.

A game of playing for time, that won twenty years, cannot be called unsuccessful. The real criticism is that Elizabeth prolonged it after hope of accommodation had vanished; so long, as to lose some of her potential allies; so long, indeed, that her envoys went to meet Parma, while the Armada was running up the North Sea. But only a rapid series of unexpected changes justified the war policy of Walsingham.

In 1580 Philip's conquest of Portugal doubled his Atlantic sea-board and his colonies. In 1584 Anjou died, Henry of Navarre, a heretic, was heir to the French crown, the Guises turned towards Spain. The same year

William of Orange was murdered, and Parma carried faster the Spanish reconquest of the Low Countries, which Don John of Austria had begun. Despairing of help from France or her own son, Mary from prison implored it of Philip, to whom she made over her interest in the English crown. Most of all, the long-pent-up passions of churches and peoples broke from the control of governments. Seminary priests and Jesuits invaded England by scores. The saintly Campion, and many more, died for a faith which Rome had made synonymous with treason. Mendoza, Spanish ambassador at London, handled the threads which, passing through the hands of English exiles like Cardinal Allen or Parsons, began at Rome or Madrid, and ended in Mary's prison. Throgmorton's plot, endless assassination plots, drove Parliament in 1585 to form the Association that pledged them to avenge the Queen's death, and to exclude from the throne any in whose interest such crimes were committed; the mere presence of priests in England became punishable as treason. The Spanish-assisted raid upon Ireland in 1579 ended in a cold-blooded massacre of prisoners, a return for the recorded and unrecorded sufferings of English sailors in Inquisition cells. While the military situa-

tion in Europe stirred Elizabeth to decision, Drake's mastery of the Atlantic was doing the like with Philip; English seamen were severing the golden arteries which enlivened the huge body of Spain.

England first took the steps that forced on collision. In 1585 Leicester was sent to Holland with an army. In 1586 the Babington conspiracy was brought home by Walsingham to Mary; in February 1587 her head, so long demanded by the English Commons, fell on the block. Having failed in an attempt to instigate Mary's murder, Elizabeth failed likewise to delay Spanish action by disgracing the secretary who had signed the fatal warrant. Diplomatic expedients were played out and, delayed but not disabled by Drake's "singeing of his beard" at Cadiz, in June 1588 Philip sent the Armada.

The great test came, and England survived, thanks not so much to the Protestant winds, as to an overwhelming English superiority in seamanship, guns, and ships. But annihilation of one Spanish fleet did not end the war, which dragged on till 1604—a weary phase of petty expeditions and starved resources, showing Elizabeth unchanged and incorrigible. The well-conceived blows against the Azores and Cadiz, the help sent to Hol-

land, Normandy, and Brittany, were impaired by faction, niggardliness, and vacillation, and the heroic action of individuals, like Norris or the fighting Veres, did less to defeat Philip than Dutch nationality under Maurice of Nassau, or the doggedness of Henry of Navarre. By 1596 Leicester, Walsingham, Drake, and Frobisher were dead, Essex as leader of the sea-war party was spirited but reckless, and Ireland began to drain English strength.

The struggle of Reformation and Counter-Reformation made Elizabethan policy not only English but British, not insular but oceanic. The infant ally, whom Henry VIII had half-consciously nourished in Scottish Protestantism, was now full-grown, and made the best safeguard against recurrence of the Catholic grouping which in Mary's first years nearly ruined England. Catholic or aristocratic reaction was able to murder one regent in Moray, to kill another, Lennox, in battle, to bring a third, Morton, to the block, but two things, more lasting than crime, every year eased the strain. The one was Scottish Presbyterianism, the other a real desire of political leaders in both countries for James' peaceful succession. The very fact that James and Presbyterianism did not agree improved

the situation in English eyes, and made James more anxious not to risk a throne that would compensate for present humiliation. He might ask, then, the punishment of Spenser for poetic license against Mary, but offered only a bald protest at her execution; filial affection (which, after all, was hardly called for) was less potent than an English pension and a guarantee of the succession. The first was grudgingly granted him; the refusal of the second explains his intrigues in all quarters—with Spain, Rome, or Essex—but essentially he depended on the good will of Protestant England, and before 1603 was on clear terms with Robert Cecil. Scotland was thus at last detached from the Continent; at last peace reigned on the Border.

But between England and Ireland the Reformation brought not peace, but a sword. The real conquest, which medieval kings never attempted, Henry VIII was compelled to undertake, if his Reformation "empire" was to last. Costly campaigns were soon abandoned for bribery and conciliation, but St. Leger's mild regime of 1540-56 broke down, less on a difference of creeds than of civilizations. The conversion set on foot was not so much of Catholic into Protestant as of elected chiefs into hereditary landlords, of a

tribal system to primogeniture and feudal tenures, and of Celtic custom to English common law. It was under the Catholic Mary that its failure was first admitted, and a beginning made with the plantations which were designed to substitute English for Irish proprietors. The everlasting feuds of Irish clans, of Geraldines and Butlers, O'Neills and O'Donnells, which had defied the Dublin Government, were changed now for an agrarian revolution, inflamed with racial jealousy and religious propaganda. Shane O'Neill's war of 1563 in Ulster was mixed tribalism and pillage, but the Desmond rising of 1579, which led to the planting of Munster, and the war of 1598-1604 were national and religious rebellions, aided by a Papal blessing and Spanish troops.

The plantation system tried to eradicate Irish civilization through English military colonies; the best blood of Devon was quartered on Munster; Londoners and Scots settled in Ulster. In a military sense, the strong medicine administered by Perrot and Mountjoy succeeded, and here and there an independent genius like the first Boyle, Earl of Cork, or a Scot colony, planted, built, and prospered. But the cost of conquest, physical and moral, was bootless. Spenser, one of the

colony whose house was fired by rebels, has told us of the state of Ireland as Elizabeth's soldiers left it; of cannibalism, of wolves, of children eating grass, "anatomies of death," creeping on all fours. Absentee landlords, adventurers who would not work, a Church whose alien service-books did not reach the people—here was a void, filled up by hungry Irish tenantry and Jesuit missions. The Ulster plantation of James' time was oppressive; Government was despoiled, the Church robbed of endowments, and despotism deprived of its sole apology, for Ireland was neither free nor wealthy.

The Elizabethan "commonwealth," which failed thus to solve one problem of empire, was a little England, whose greatness rested on command of the sea. This, for the first time, became the key to English progress, not so much by effort of the Government as from spontaneous, individual, energy. Henry VIII's European policy and Spanish alliance checked any tendency to pursue the paths opened by the Cabots, and it was not till the middle of the century that English commerce launched out on the ocean. The Dudleys and Howards began, earlier, to invest money in Mediterranean trade instead of English land, but the real lead was given by London mer-

chants with Bristol and Western ports close behind. In Elizabeth's reign enormous profits urged and rewarded the Protestant party; large sums were hazarded in sea ventures by Leicester, Walsingham, and all the noble adventurers, the Raleighs, Cumberland, and Gilberts. £5,000 was put up for Drake's circumnavigation of the globe; the profits to the shareholders were £500,000, and to the Queen the same.

At first inspired by gold, then by religion and policy, only last by a conscious colonial scheme, the English tried every opening in new worlds and contested the monopoly of Spain, Portugal, or Venice in the old. Chancellor, seeking a North-East Passage to India, reached Archangel; Jenkinson pushed on to the Volga, the Caspian, and Bokhara; soon the wild Shirleys were living as princes in Persia. Trying a North-West Passage, Davis and Frobisher staked English claims on North America. Hawkins, following others, deported from Guinea and the Gold Coast slaves whom he sold in Spanish America, and taught Drake to defy the preserves assigned by Rome to the Catholic kings. The Spaniards' treacherous attack on his fleet off Vera Cruz in 1568 began that never-ceasing war between Philip and the adventurers, which

drifted into a war of nations. The Queen's connivance overcame the opposition of Cecil, his disapproval of piracy, and his reluctance to part with the Spanish alliance. When, after three years spent in forcing entry to the Pacific, sacking the fount of Spain's treasure at Valparaiso, and returning by the Philippines, Java, and the Cape, Drake was knighted in 1581 on the *Golden Hind*, the Crown accepted the New World from its seamen, and the epic age of Elizabeth dawned. We find Englishmen commanding the galleys in Russia, jewellers to Akbar at Delhi, organizing the navy of Japan. Humphrey Gilbert, returning in his ten-ton *Squirrel* from exploring Newfoundland, found heaven near by sea. The heaven, or Valhalla, of fighting men opened in the Azores for Richard Grenville, who there in *Revenge* fought fifty-three Spanish galleons. Piratic war and Calvinism made that heroic temper in England, which pride of race and Catholicism gave to Spanish *conquistadores*. Drake, served in his cabin off silver plate, the violins playing on *Golden Hind*, executing on solitary islands the mutincers with whom he partakes of the Sacrament; Cavendish, sailing up the Thames with sails of blue damask, his crew each with a golden chain, Elizabeth waving

her hand from Greenwich Palace; Hawkins' slavers, in confident dependence on their "Almighty God, who never suffereth his elect to perish";—every year English patriotism rose more feverishly as these extraordinary men, fresh from playing football with Eskimos or bowls in Panama forests, or turning neutral traders adrift in mid-ocean, returned with their gold, ivory, palm oil, and cinnamon, to sit in the House of Commons and plan interception of next year's treasure fleet.

The experience of seamen and merchants introduced two vital changes in the instruments of English policy: the remodelling of the Navy and the foundation of commercial companies. The "great ship" of Henry VIII, superior to Mediterranean galleys, but still slow and cumbrous, gave way to flush-decked smaller ships, which made rings round the Armada and lasted in type till Nelson's day. Seamanship and gunnery were taught by experts, who had bought experience dear in forty years of ocean warfare. Meanwhile, charters and statutes set up the joint stock and regulated companies—Muscovy, Levant, Eastland, and East India—which massed the new capital of England for continuous enterprise, and by permanent factories and trading

alliances laid the foundations of empire. The beginnings were precarious, but before the Queen's death Raleigh perpetuated her name in Virginia, fishing fleets were annexing Newfoundland, and Wiltshire factories testing their kerseys on the natives of Bengal.

The new companies' charters, bidding them maintain a high standard of craftsmanship, showed that the Government had inherited an ideal from the guilds. All the characteristic methods of earlier trade policy were continued by Burghley; their characteristic evils had not disappeared, but the methods were more elastically applied and the evils diminished. The Statute of Labourers (1563) aimed at redressing, in a conservative sense, the balance upset by weak government and violent oscillation. Its purpose was to grade the whole working population; to retain the skilled trades for corporate towns, to make apprenticeship the regular avenue to industry, to stabilize employment by standardized conditions of service. Tariffs maintained the staple home industries, while the justices were expected to protect employees by fair wages. Burghley was a mercantilist of more modern type; he looked to bullion less than the balance of trade, less to prohibitive Navigation Acts than to new

markets. Government used its power in encouraging new industries and immigration, and the patents or monopolies granted, if sometimes abused by courtiers like Raleigh, on balance did increase the national riches. The suppression of the Hanse privileges and the exhaustion of Venice freed commerce from its oldest rivals. Protestant theology reinforced capitalist theory, in justifying loans at interest as a necessary weapon of extended trade, while bankers and insurance supported the credit that now rested on London, instead of Antwerp.

The land, still the resource of four-fifths of the people, was reaching the equilibrium that lasted for a century. Enclosure went on, but with less violence, and partly for tillage. Policy regarding the food supply was opportunist; the level of prices was watched by royal commissioners, and sales, export, and import, were regulated by the Council in touch with local authorities. The Poor Law of 1601, codifying half a century's experiments, replaced the Church's control of charity by the municipality and parish overseers; distinguishing the vagrant from the unfortunate and "poor in very deed," it made the parish the unit of relief, allowed the principle of a rate in aid, encouraged provision of work for

the workless, and the house of correction for the vagabond. Over the whole of this economic fabric Council and Star Chamber watched, interfering to protect tenant-right, insist on fair wages, or stop profiteering. Their policy was the beginning of the end of paternal government, but it succeeded in its main object, to keep the balance of the whole. Figures of building, statistics of customs revenue, and the capital sunk in land, prove the swollen volume of national wealth; legislation and Council records show its considerable success in achieving an equitable distribution. The petty capitalism of the Domestic system of industry covered the countryside; the cloths of East Anglia and Wales were sold at Cairo or Narva with those of Yorkshire and the Cotswolds; small farmers and yeomen still marked a deep line in the subsidy book.

Indictments against whole ages or classes falsify the workings of nature, but a great literature declares the gloom in which the reign departed. War was raging, severe plague, heavy taxation, religious discontent. *Nouveaux riches*, beggars, sham adventurers, corruption, and the wisdom of riches, lit up the sins of a new acquisitive society. Irish campaigns made the fortune of victuallers, gambling on the exchanges with Government

money that of royal servants. The gold was wearing off the apples brought back from the garden of the Hesperides. The bid of young Essex for power failed, but round him there gathered many elements of opposition—Catholics, liberal thinkers, Puritans, lovers of war—and the execution of this spoilt popular figure in 1601 only postponed a day of reckoning.

The nation, however, was still loyal, and its condition vastly better than at the death of Henry VIII. In place of armed magnates, of religious and social chaos, of the knife and forays on the marches, the Queen bequeathed, unsettled but solidifying fast, all that makes up a civilized state. Only partiality or cynicism can dismiss the public spirit of Burghley or Walsingham, the paternal activity of Government, the mass of private benefaction, the assured increase of regard for equal justice, or doubt the existence of a people that centred its commonwealth in the Crown. Against its foes, this Government used torture, spies, censorship, and martial law; to loyal subjects it gave a rule more honest, more even-handed, and more rewarding than any that had gone before. To her last Parliament Elizabeth appealed: "Above all earthly treasure, I esteem my people's love, more than which I desire not to merit."

CHAPTER VI

CHURCH AND STATE

THE House of Commons of 1604 told James I that he was "misinformed" as to their privileges; only the Queen's sex and venerable age, they implied, had stopped them from asserting their legal authority in State and Church. During the next thirty years Puritan common lawyers elaborated this conservative view of the revolution they were asking, and successfully convinced posterity that the Stuarts caused civil war by plotting to subvert an ancient Constitution. A later generation, who saw in 1640 only a consecrated halting-place between Magna Carta and the Reform Bill, darkened this picture of an executive encroaching on the legislative power, and it has been left to modern scholarship, particularly in America, to demolish the constitutional theory of the Pilgrim Fathers, and relegate the legend of "despotic" Stuarts to the same limbo as that of "parliamentary" Lancastrians.

The constitutional problem of Elizabeth and James should not be viewed through a telescopic lens of 1832, but in the broken light of the medieval Government they inherited. The rule of law in that Government was not the exclusive supremacy of Common Law; indeed the bare idea of a sovereign unity—whether King, Parliament, or one branch of the law—was alien to the fifteenth century. True, in one sense men looked on their Government as unitary, since the executive, legislative, and judicial powers were all centred in the King and Council. But, in another sense, Government was quasi-federal; for the Crown had inherited functions coming from different sources, and was daily acquiring others. Certain powers the King had as Duke of Lancaster, some as head of the feudal structure, others as overlord expected to direct foreign relations and defence, others (under the Tudors) as head of the Church. These functions, in part older than Parliament, but in part arising after the sphere of the Lancastrian Parliament had been more or less determined, were exercised through different agencies of the Crown, such as Admiralty, Chancery, or High Commission. The King's Council might be continuously expanded, by many degrees, from half a dozen experts up to the full

meeting of four hundred in the great Council of Parliament, and only custom assigned specific duties to any particular branch of it.

Neither the lawyer nor the ordinary Tudor layman thought of their Government as a despotism, but the checks and balances upon royal authority were negative and medieval. That is to say, Parliament was recognized as the King's Council at its highest pitch, and the Common Law fully protected the elementary rights and properties of all men; a legal champion of the prerogative like Bacon accepted these positions as fully as a fanatic for the Common Law like Coke. But few men, till Coke, would argue that Parliament or Common Law were the sole source of legal authority; the King's prerogatives, in the field not yet covered by Parliament, were viewed as forming part of the law. Cranmer's Litany, after all, omits the infrequent Commons, and asks the congregation to pray only for the Crown, nobility, Council, and magistrates. If Henry VIII was the restoring architect of Parliament, he did not demolish older chambers of government, and distributed the mass of new business involved by the modern state among all his councils and commissioners. Historically, he had undeniable right to delegate powers to branch

councils in North and Marches, or to temporary commissions, and no legal objection was taken to Elizabeth's activities as head of the forces or arbiter of foreign policy.

How profoundly this use of an extra-parliamentary prerogative affected the man in the street can best be seen in the immense powers given to Justices of the Peace; the Council would tell them to conscript recruits, to force employers to take on discharged soldiers, to fix grain prices, or commandeer carriage. With all such manifold activities of a modern state, statute and common law as yet hardly dealt. But if questions arose of a conflict between prerogative and law, the only court of appeal could be the judges, who attended Parliament as its legal advisers, drafted bills, and approved proclamations. Northumberland thus referred to them Edward VI's last testament, Burghley the Queen's powers under the Supremacy Act and her power to commit prisoners. The Stuarts' constant reference to them was thus warranted and inevitable, for they alone were recognized arbitrators on a fluid constitution, which events were straining beyond endurance.

Renaissance and Reformation, the events in question, were indeed giving to the world new doctrines, which must sooner or later settle

this decision of sovereign power. Already Henry VIII had found it useful to condemn by statute the recurring fallacy that land belonged to the people as a whole; already French thought was teaching that a ruler who offended the people could be deposed; by the time of the Petition of Right, the notion of a contract as the origin of government had become a commonplace of debate. On the other side, revived Roman Law armed the King with Cæsar's inviolate majesty, Machiavelli's "Prince" taught the necessity of absolutism, the Church's homilies a duty of passive obedience to the Lord's anointed. But abstract notions of despotism, while they inflamed, did not provoke the English contest; nor did abstract ideals of liberty cause that rapid advance of Parliament and Common Law which transformed the constitution in the late sixteenth century. This change was due to practical politics and the rule of Henry VIII.

The Commons' debates in the generations after 1558, whose startling ability arrests us in D'Ewes' or Burton's journals, were not the product of immaturity. A century of classical education and the open Bible, the same of strenuous local government, gave political insight to a class enriched by speculative

commerce and monastic lands. Bereft of support from Church and nobles, Henry submitted his measures to the bourgeois; the councillors were brought into Parliament to carry royal policy, which the Commons thus learned to discuss with Cromwell or the Cecils. The Crown's careful selection of Speakers, candidates, and new constituencies is the best tribute to the power it had evoked; its enforced deference to middle-class opinion soon found an echo in constitutional claims. The best county families contested elections; opposition meetings outside Parliament embarrassed Elizabeth; in debate, or through the Press, they voiced public indignation at the Government's mercy to the Scottish Queen, or its rigour to godly ministers. From the middle of the century fusion between prerogative and law grew apace. An Act of Edward VI was held necessary to confirm Henry's prerogative Court of Augmentations, and Elizabeth passed her Wardrobe accounts through the Exchequer. Her ministers were meticulously respectful to the law, and anticipated in practice the judges' decision of 1610, that proclamations did not make law, so much as expound it. The modern lines between executive and judiciary became clear, Star Chamber itself almost a law-abiding

public tribunal. With the growth of national unity and secular public opinion, the Common Law courts attacked High Commission, the Court of Requests, and the Northern Council; the Commons questioned the unstatutory basis of the Church, or the royal grants of trading monopolies. A demand for certainty and fixed legal rule was in the air, flooding one by one the compartments of a loose, discretionary, haphazard Constitution. Common Law pressed these innovating claims in the guise of antiquity, a school of legal antiquarians from Coke to Prynne producing from imaginary statutes, or closed Year-books, the precedents which were to justify the ways of revolution.

Their work was to save the country, but it falsified history, and if legality could excuse incompetence, the Stuart cause was impregnable. The main constitutional charges against them were taking ship-money from inland towns, adding impositions (or additional duties) to the tariff, giving monopolies to corporations, punishing soldiers by martial law, dispensing with the law in favour of individuals, and debarring Parliament from touching the Church. But all these powers could be deduced from the Crown's inherited functions, and all were taken as of course by

Elizabeth. She, like the Stuarts, recognized the Commons' privileges of debate, but none to "frame a form of religion or a state of government, as to their idle brains shall seem meetest." She sent to the Tower private members who trenched on these mysteries, and extinguished many private bills. She, like James, claimed for Chancery the control of contested elections; her judges, like Charles', held that the Crown need not show cause for its arrest of prisoners. If, then, there was any Tudor constitution, all the Stuarts did was to try to maintain it, and though those who thus stand still may cause a revolution, it is an inexactitude to call them the revolutionaries.

The wise moderate Puritan, Selden, looking back during the Civil War, put his finger on its real cause. "*Scrutamini Scripturas*—search the Scriptures; these two words have undone the world." Walsingham's brother-in-law, Peter Wentworth, did not risk the Tower for abstract freedom of speech, but for liberty to attack bishops, whom he viewed as pseudo-Popes. The Commons refused supply to James, primarily because he was too lenient to Catholics and protected High Commission. Not so much ship-money, as the barque of Peter, in which room (they felt)

was reserved for Laud, turned passive resistance into active revolt.

Of the forces hostile to Elizabeth's settlement, the Catholics became, after the Armada, almost negligible. Pius V's Bull of 1570 gave them little choice between heresy and allegiance and, coupled with the plots that followed, split them into two camps. There were those—Jesuits, conspirators, and saints—who followed Campion to the scaffold; others, swayed more by secular priests, members of county families, or less devout, either submitted to recusancy fines and more or less easy imprisonment, or by hearing private Masses from some wanderer excused a forced attendance at their parish church. The Gunpowder Plot of 1605 deepened their dissensions. The extremists, infuriated by disappointment at James' illusive promises and inflamed with the spirit which soon plunged Europe into thirty years of war, finally ruined their Church in English eyes. The Commons' rage pressed down guilty and innocent alike in new crushing legislation; eight or nine thousand recusants still witnessed to Catholic religion, but the general loyalty of Catholics to the Crown in the Civil War sharply distinguished them from other enemies of Anglicanism.

The spiritual leaders of Protestantism who survived Mary's persecution did so by flight to Geneva, Frankfort, and other cities of refuge. Thence they returned in 1558, recharged with those views which once before, under Edward VI, had broken up King Henry's settlement. The essence of the reformed Churches they had found abroad was undeviating obedience, as they interpreted it, to the Word of God, which defined not only a pure doctrine, but also the details of Church government, rites, and ceremonies. Between such men and Elizabeth there could be no agreement. She, mainly for political reasons, wished to preserve all she could of the pre-Reformation Church; they, in the name of Christ, now newly revealing Himself, to destroy it root and branch. The preliminary "vestiarian" controversy over the surplice touched, then, only the fringe of a question, which went to the very basis of religion. The Anglican view of Scriptural authority, stated long ago by Thomas Cromwell, distinguished between matters necessary to salvation, for which Scripture provided, and things "indifferent," such as government or ceremonies, which were left to the direction of national Churches. On this theory the controlling voice should be left with the sovereign,

to whom the Reformation had restored prerogatives usurped by Rome.

Unity of Church and State was, in some shape, still the universal opinion of Europe, and the common ground of obedience in Elizabeth's early days was that Puritanism meant anarchy. The majority of her first bishops—Jewel, Horne, or Grindal—viewed their office as no divine institution, but as an allowable office of ecclesiastical police; they wore the vestments with reluctance as things distasteful, though "indifferent," and had to be goaded by the Queen into suppressing their more advanced brethren. Her suspension in 1577 of Grindal, Parker's successor at Canterbury, marks the beginning of modern Anglicanism. The spiritual head of the Church was thus dealt with for his failure to suppress "prophesyings," or meetings of clergy and laity to discuss religion, which half the bishops approved. In them Elizabeth saw the germ of Presbyterianism, whose "parity" she sincerely held to be "dangerous to a kingly rule." From the point of view of Tudor government, she was right, though Puritanism in England embraced many more than Presbyterians.

Omitting the "Family of Love" and minor sects that periodically agitated London, Puri-

tans could be divided into three main bodies. Least numerous and important before 1625 were the Independents, earlier called Brownists, after Robert Browne, whose book raised the cry: "A Reformation without tarrying for any." Their principle was each congregation's autonomy; their crime, repudiation of any State supremacy; their merit for the future, a claim for tolerance. It was men of this type who wrote and printed the "Martin Marprelate" libels against the bishops, for which their leaders were brought to execution; Archbishop Whitgift's severity drove the extremists into exile in Holland, whence a remnant in 1620 carried to a New England the ideal Church so unappreciated in the old.

The Presbyterians were more organized, persistent, and formidable. In Geneva, La Rochelle, or Edinburgh they had models and supporters. Their leaders were learned and influential—men like Cartwright, professor of divinity in Cecil's own University of Cambridge, or Travers, the tutor to Cecil's children. Their platform was openly announced in 1572 in the "Admonition to the Parliament"; their tactics were furtive—to stay in the Church, but to recase her decadent system with their own. Presbyterian assemblies met

in London. The *classis*, or kirk session, was illegally linked to the Church system in the Midlands and East Anglia. A Dean of Durham, ordained only at Geneva, for twenty years avoided deprivation. In many parishes ministers approved by illegal synods declaimed prayers equally illegal.

Shading into the Presbyterians was the largest section of all, perhaps two-thirds of the laity, who wished a broad Church establishment on Puritan lines. The Queen's ministers were at their head. Cartwright was patronized by Leicester; Walsingham, Knollys and Mildmay instigated, or introduced into Parliament bills against the Prayer-book. No session from 1563 to 1640 passed without some move from the Commons, for relief from ceremonies, and from subscription to the Articles, or for tempering of episcopacy by Presbyterian "assistants;" if the Commons were representative even of the aristocracy, the political majority of England was clearly against Elizabeth's settlement.

The Commons of 1604 disclaimed the name of Puritan, but the ministers for whom they asked relief urged, at the Hampton Court Conference, the association of presbyters with bishops; county petitions demanded reform "agreeable to the example of other reformed

churches"—the very formula which in 1648 was to unite Presbyterians of England and Scotland in the Covenant.

Nothing could have long prevented this blending of religious with constitutional opposition, but the anomalies of the Constitution provoked it; and on the question, whether it was a royal or a parliamentary Church, civil war began. It was true that the Six Articles and the Prayer-books were passed through Parliament, but there, in Tudor law and practice, parliamentary co-operation ended. Like her father, the Queen upheld this bare parliamentary scaffolding by royal action. The Supremacy Act empowered her to set up a High Commission, but the Commission's mandate was devised with her bishops. The Act of Uniformity allowed her and Parker to reform ceremonies, but their prerogative Injunctions regulated the dress of the clergy and the position of the altar. An Act of 1571 demanded of the clergy subscription only to such of the Thirty-nine Articles as concerned faith and sacraments; going directly counter to this, she amended them in concert with her prelates, and systematically enforced obedience to them all. Gradually, it became clear that nothing short of attacking the royal supremacy would get for the Commons what

they wanted. Nothing less could invalidate, for instance, the canons of 1604 which, assented to by Crown and Convocation, demanded of the clergy a declaration that the Prayer-book contained nothing contrary to God's Word. From about 1590 the common lawyers urged a concerted attack on High Commission. Just as Star Chamber, they argued, was restricted by the statute of 1487, so was this Court tied by the Act of Supremacy, which had given no powers of fine and imprisonment. Repeated declarations of Council and Chancery, basing the Commission's jurisdiction not on statute but on the immemorial supremacy of the Crown, brought the conflict to a head. Whatever the letter of the law, all the fervour of religious men and all the instincts of lawyers were outraged by a half-lay, half-eccelesiastical Court, examining accused clergy upon oath, evicting excellent pastors for non-compliance with prerogative rules, evoking cases from every diocese, searching private houses for suspect books.

It had become, then, a war of first principles, and this in more ways than by conflict of laws. Religious differences in 1560 had turned upon expediency, or mere law and order; by 1600 they revolved round dogma, and exposed deep intellectual contradiction.

The Arminian, or (more familiarly) Laudian, movement began in the field of pure theology with a protest against the Calvinists' rigid pre-destination, and with insistence on the freedom of human will. Revolting from the claim that salvation could be won merely by faith, Laudians returned to the Catholic teaching of the necessity for good works. They contemplated, that is, no church of "saints" justified by a self-known declaration of faith, but one of average human beings, using those works of holiness and those sacraments which were consecrated by sixteen centuries of Christian usage. From individual interpretation of the Book, they returned to the corporate authority of the historic Church; they made reason, and no sudden "jump into glory," the pathway to a saving faith, and held that, in the light of reason, each national Church could regulate those "indifferent" matters, for which Scripture had not clearly provided. Richard Hooker, wisest of English conservative thinkers, began in 1594 the publication of his "Ecclesiastical Polity." He taught that law was the justification of society, that the burden of argument must always lie on the individual who challenges it. The usage of antiquity must occupy the ground until it was demonstrably refuted;

CHAPTER VII

THE FIRST TWO STUARTS, 1603-42

LONG continuance of Government's outward forms often masks internal revolution, and the identity of the Stuarts' aims with those of Elizabeth was not inconsistent with sharp differences in method, efficiency, and atmosphere.

It is true that their difficulties were inherited from the Queen, and that Parliament from the first took the aggressive. The finances demanded retrenchment and reform. Between 1588 and 1603 taxation had been thrice as great as in the whole preceding thirty years; the Irish wars bequeathed a heavy debt; standing revenues were depreciated by change in values and diminished by sale of Crown lands. The Commons, insistent on religious reform, refused to fill the gap, and to them was due the lasting poverty of the Stuarts, which in its turn had for a century such far-reaching political effects. Claiming from 1603 to control religion, the Commons also extended their "privileges"

to lengths never allowed by Elizabeth—to foreign policy and initiation of public bills.

Nor can history agree that the cause of freedom and justice was wholly bound up with the victory of a narrow, bitter, and class-conscious Parliament. They rejected with petulance proposals for Anglo-Scottish Union. Their treatment of Catholics was brutal, and a jingo Protestantism represented their foreign policy. Of those whom posterity must judge the great minds of the age, a majority—Bacon, Hooker, Strafford, Shakespeare, Hobbes—were enlisted on the side of authority, which was attacked for what justly may be viewed as its good points, as well as for its bad. Administratively, the Government had much to commend it. The Council was active in keeping the balance of classes, in maintaining wages and employment, in reducing prices. The radical Levellers' grievances after 1649 show how little the Puritan political class cared for democracy; the lot of Catholics and Episcopalians, the hollowness of their toleration; "the curse of Cromwell," the solution offered to Ireland; the extinction of the drama, their lop-sided civilization; the free rein given to individualist capitalism, the negative contribution of Puritan religion to social welfare.

But in days of Parliamentary and individual growth paternal authority can only be preserved by constant strength, skill, and sympathy. These were now lacking, and nothing is more startling than the solid national opposition found in 1640. The Stuarts were aliens; so were their favourites, Somerset or the Hamiltons. James' costly and squalid Court dispelled the glamour and mystery that enshrined Elizabeth; his unbusinesslike habits made ridiculous the claims which a pedantic scholarship put forward for the divine right of Kings. The Queen, partly owing to her sex, ruled Parliament from the inside through ministers of proved parliamentary power; the Stuarts hectored it from without by new-made peers or favourites, leaving a series of pedestrian secretaries to debate with Eliot, Pym, and the acutest of common lawyers. In an age which revered birth, the oldest and most powerful families were affronted. Whereas Elizabeth had created eight peerages, James made sixty, selling many as he sold baronetcies, for cash down. Landed interests were disturbed by revival of obsolete taxes and drastic fines for encroachment on half-forgotten forests. Like Henry VIII, Charles prevented Opposition peers from attending Parliament. When the

war came, the peers who resisted the Crown or stood neutral included the bulk of the names—Percy, Russell, Sidney, Cecil, Rich, Herbert, Devereux, Montague, Cavendish—which had won most glory under the Tudors.

Economic grievances quickened in the trading classes the hostility bred by Puritanism. The struggle from 1604–14 over impositions and tariffs left the shadow of legal victory to the Crown, and unquestionably the judges, in maintaining its right, whether directly or through a chartered company, to levy duties on any commodity, could quote Tudor example. But the common lawyers in Parliament contested their law, while practical reasons made their decision intolerable. For the Customs were the one expanding source of revenue, and four-fifths of them were raised at London, the spiritual centre of opposition. Moreover, the industrial fabric was becoming too complex for conciliar control, and James' well-meant effort to direct the vital cloth trade by proclamation may well be one root of the solid Parliamentarianism of clothing districts in the war. Nor was this paternal authority even incorrupt; the monopolies granted in soap, saltpetre, wines, or alehouses, led directly to speculation and oppression. Interlopers began to challenge

the chartered companies' monopoly in the East Indies, Baltic, and Levant. Enterprising capitalism broke at a hundred points from the Government's control. Merchants used against it the new weapon of financial credit, which they had freely loaned to Elizabeth, and drove the King back on further use of a strained prerogative.

For if on the letter of the law the Stuarts' case, till 1629 at least, must be held impregnable, it belied the spirit of the Constitution. Governments are not commonly ruined by strong action, but by weak action joined to strong words, and the bark of the Stuarts and their advisers roused at least as much sense of injury as their bite. It was one thing for Elizabeth to deny freedom of debate in some particulars; a very different to reiterate, like James, that all privilege was a matter of revocable royal grace. Expensive currants seemed more indigestible when judges had pronounced the power of levying impositions to proceed from an absolute authority above law. Men who from 1634 onwards, when coal ships and Channel packets were intercepted by corsairs, recognized the need of financing the navy, felt differently when the King was declared sole judge of national danger and of the means to avert it. The Tudors did not

compare questioning of their prerogative to atheism; they had not avowed that they owed account to God alone, nor that ministers were answerable only to themselves. They did not, like Laud, ostentatiously promote divines who preached absolutism, even extending to taxation. No bull, not even John Bull, can bear an indefinite trailing of the red flag; it was this everlasting rehearsal of "a logic which left no man anything he might call his own," which infuriated a generation devoted to individual property and individual religion.

Till 1629 the Crown, asserting legal precedents, kept up a long course of rearguard actions. It maintained its Church powers by the help of High Commission, and its right of levying impositions by that of the ordinary judges. This undecided struggle between prerogative and common law was impersonated in the memorable rivalry between Francis Bacon and Edward Coke, which reached its climax in the elevation of the first to be Chancery and the dismissal of the second from the Bench. Springing from the same bed of Tudor official compromise, they were rapidly separated by James' quarrel with parliament; Bacon, once a House of Commons man, to pin upon prerogative all his ambitions

of legal, religious, and Imperial reform,—Coke, once Elizabeth's Attorney, to restrict legality to common law and statute. In their contest Bacon made law subservient to arbitrary politics, Coke twisted history to construct an arbitrary rule of law; each, clapping the telescope to his blind eye, saw clearly half the truth. In the end Parliament, taking Bacon's teaching of sovereignty and Coke's legal basis, made a fusion of their views, but this was still far distant. For the present, as in the impeachment of Bacon and the monopolists in 1621, or in the controversy over the Commons' refusal of revenues for Charles' life, each side made a negative and unsatisfying appeal to "the law," to that body of ancient customs and "fundamentals" descending from times unconcerned with unitary and legal sovereignty. Of this the Petition of Right (1628) was clear proof. The grievances were glaring and generally admitted; unparliamentary taxation, billeting of soldiers, martial law, and imprisonment without showing cause. But save the first, these were the very powers which any State must possess in emergency. Merely to deprive the King of them, or disavow (like Pym) the existence of sovereignty, was the constitutionalism of the ostrich: especially when the judges did not accept the Petition

as a statute at all. If such powers were so inherent in sovereignty that "no acts of Parliament make any difference," the real point at issue was, in whose hands they should be. The year 1629, which saw the stormy dissolution of Charles' third Parliament, is vital in history, for upon this point of sovereignty a section, stronger as yet in talent than number, left the opposition for the Crown, and prepared the birth of parties.

"The grand apostate" of this group was Wentworth, later Earl of Strafford, who represents the first phase of royalism on its good and its bad side. He was apostate only in the sense that he would advance no further; for his early career was passed in attacking Buckingham, the "Haman" who stood for wasteful foreign adventures and crude illegality. Wentworth wished to vindicate England's "ancient and sober liberties," but in declaring the law in 1628 he insisted there must be left a discretionary power with the executive. Parliament was "the old and beaten way," but *salus populi, suprema lex*; the King was *pater patriae*, and individual liberty must yield to common good. Hating war and loving strong government, he saw in the Crown the keystone of the arch. His later experience as President of the Northern Council and Deputy in Ireland deepened

the conviction that government was "going downhill," pushed down by riotous gentry, or the Irish landlords, whom he compared to Turkish pashas. He disdained to see the common lawyers "snuffle upon" the flowers of the prerogative, which were to be used, as they were by himself in Council and in Ireland, for defence of the lowly and destruction of great offenders. In the "Pyms, Bens, and Prynnes" of Puritanism he could see nothing but anarchy or spiritual arrogance. Some day, power would come full into play; meantime, the King must cherish the prerogatives inseparable from the idea of the State; his servants must hew, and fend, and toil for justice and order; "less than Thorough will not do it."

The "*cancerous malignity*," which Strafford would cut out of the State, went far deeper in the Church, and the task of Laud was more hopeless. His ideal was that of Henry VIII—the English Jerusalem "as a city at unity with itself;" his intellectual background that of the older Arminians, of a Church grounded in reason, law, and antiquity. He believed that an outward uniformity would bring about spiritual union, and that decency in public worship would redouble the compelling attraction of Catholic truth. His

moral courage was great; he was not afraid to pillory sin in high places, or to protest against enclosures by the Crown. Unhappily, his religion was not tempered with common humanity, nor his fine ends by any discrimination in means. To make Bishop Juxon Treasurer and many clerics justices seemed to him an important triumph. His sentence in Star Chamber was always for punitive fines and mutilation; the God he adored allowed him to divide husbands from wives and children, or chase down even in the Colonies the emigrants his severity had made. With dubious legality, he enforced the railing in of altars and bowing at the Sacred Name, and forcibly put down lectureships, which Puritan funds had endowed to eke out the spiritual poverty of parish churches. He ruined Hooker's appeal to reason by the methods of a Provost martial, and rested the Church's cause on a State jurisdiction which every day was more challenged. The Puritan charge of Romanising was entirely false of his personal leanings, but nothing could be more natural; for reunion with Rome was in the high Anglican air; it was discussed with Papal legates in London; conversions to Rome were fashionable and constant.

So long as opinion in England is free, men

will always think differently of Laud and Strafford. Their aims were lofty, their personal influence on their age profound, and much of their teaching against bad aspects of individualism has had lasting effect. But on the whole it is fair, perhaps, having seventeenth-century England in mind, to say of both what Clarendon said of Laud, "a man unfit for the state of England." For England was not Ireland, and Milton's generation could not be retained by the material swaddling bands which had done duty under Henry VIII; whatever unity could be achieved must come through the spirit, and rest on an informed free opinion.

The doom of Thorough came all the more surely because England was become politically one with Scotland and Ireland, and intellectually with Europe; it was their foreign policy which lost the Stuarts their prestige, that last raiment to cover the nakedness of a despotic land. The peace of 1604 with Spain was a financial necessity, and honourable in its terms, and till the death of Salisbury and Prince Henry in 1612 there was weakness, but no irremediable blunder. Thereafter foreign policy, as conducted by James, Charles, and their favourite George Villiers, Duke of Buckingham, was irresolute, reckless,

and unsuccessful. James' motives were worthy, for he would be the peace-maker of Europe, but impracticable, since he hoped to bury religious division. The Thirty Years' War broke out in 1618; it was brewing since the murder of Henry of Navarre in 1610, which delivered France to a weak regency, and Europe to the Hapsburgs' Catholic crusade. With incurable optimism James planted a foot in either camp. His daughter Elizabeth, the darling of the country, married Frederick, Elector Palatine, head of German Calvinists, who accepted the Bohemian crown from Austrian rebels: for his son Charles, James planned marriage with a Spanish Infanta. English embassies, unsupported by ships or men, advertised to Europe the weak philanthropy of the English King, whose vacillations and suspicion of his Parliament were inflamed by Gondomar, the sinister Spanish ambassador at London. Spanish and anti-Spanish factions disordered the Council; whatever the previous factiousness of Walter Ralcigh, whose thirst for power had led him in 1603-4 into sedition, his execution in 1618, after a last fatal voyage to Guiana, was interpreted as a sacrifice to the will of Spain, whose spoils he had laid at the feet of Elizabeth. Bankrupt of resources, James hoped to recover the

Palatinate, of which Spanish troops robbed his daughter, by a Spanish marriage for his son, and the wild ride of Charles and Buckingham to Madrid showed the criminal levity of English rulers. For the match turned upon rights of worship for Catholics which no Parliament would concede; it was broken off on the Palatinate question and Buckingham's personal quarrels with the Spaniards; it was followed by a popular, but senseless war.

The first years of Charles saw the process repeated with France. We get the marriage with Henrietta Maria, with concessions for Catholics which could neither be enforced nor forgotten; help sent to France against the Huguenots; grandiose subsidies and alliances with Denmark and Protestant Germany; war with France over the right of search in the Channel, over English contact with Protestant La Rochelle, and Catholic disappointment arising from the marriage; futile expeditions to Cadiz and Flanders. In the end Buckingham, the tragic comedian of English statesmanship, was murdered by a fanatic who had missed promotion, and in 1629 a dishonourable peace was patched up with both France and Spain. For the next twenty years England ceased to count in Europe. Richelieu treated with contempt Charles' plans for restoration:

of his nephew in the Palatinate; Spaniards and Dutch fought out their quarrel in English territorial waters; the Dutch alliance was lost in commercial rivalry. Despatches were loaded with possible alliances, but a King of England who had quarrelled with his Parliament was not worth even a scrap of paper. But Europe counted in Protestant England. In his fens Cromwell heard how the Swedish hero Gustavus had fallen, how Protestantism was threatened in Holland, and almost extinguished in Germany. To the Puritans the spirit incarnate of this evil was the gay beauty, Henrietta Maria, who in peace, as later in war, damaged her devoted husband's credit with his people. The Mass in her chapel scandalized London, which feared a repetition in England of the Jesuits' triumph abroad.

Scotland and Ireland were nearer dangers; in them the Opposition's fevered imagination descried armies of kernes and Highlanders being prepared to overthrow the Reformation. But the Crown's position in Ireland was, in hard fact, desperate. When Strafford went there in 1633 he discovered, as Henry Sidney had in Elizabeth's time, two races warring in the bosom of one country, and each a threat to royal supremacy. For much of its

weakness, and most of the misery of the Catholic Irish, came from the new Protestant ascendancy, who had flocked in with the plantations. O'Mores and O'Connors could still raise a riot of evicted Irishry, but the Boyles, Annesleys, and other great "undertakers" had hold of the land (much belonging properly to the Church), the offices, and the legislature. Their ascendancy, however congenial to Protestant England, meant injustice to Ireland, hence bloodshed, hence an army. and thence excessive expenditure. Partly, then, in English interests, but with real indignation at the rapacity of these "ravens," Strafford began the herculean toil of making Ireland a royal province, evenly balanced between Protestant and Catholic, self-sufficient and self-defending. Often stultified by Charles' grants and favouritism, he drove by reckless short cuts towards his end. He wanted Ireland securely knit to England; therefore, with too much breach of faith, he proposed to "plant" Galway. He wished her prosperity; by tariffs, monopolies, and subventions, he quadrupled her revenues. He wanted her Anglican; therefore he suppressed the Scottish Presbyterians of Ulster. The events of 1641 showed on what a razor edge of hatreds he had walked. A stream of

protests from Protestant landowners contributed to his impeachment. The "ascendency," left to themselves, drove the Irish to begin the agrarian war of 1641, which ended in racial massacre. Puritan England concluded that the Arminian faction round the King had instigated a tragedy which was, if successful, next to be played in England; grimly they tightened their belts to deal, as Cromwell wrote halfway through the process, with "these barbarous wretches, who have imbrued their hands in so much innocent blood." The King's truce with the Irish in 1643 finally condemned him; Irishwomen were killed in cold blood at Naseby by the Puritan troops.

But the immediate occasion of the Stuarts' ruin came from their native land. James had reached England in 1603, fresh from a first victory over Scottish Presbytery, "which agreeth as well with monarchy as God with the devil." The cause of God, thus measured in terms of Episcopacy, made fair progress for the rest of his reign. The Articles of Perth (1618) tried to enforce kneeling at Communion; a High Commission was set up for Scotland, while the consecration of the Scottish "constant moderators" by English bishops revived the Apostolic Succession,

which the Presbyterian fathers, Knox and Melville, hoped they had destroyed. Economic prosperity, which accompanied this despotism, would only ensure peace so long as the nobles and lairds continued their support to the Crown or their neutrality, but all hope of this disappeared when Charles, in his first year, passed the Act of Revocation, withdrawing from them such grants of Church land as they had received since 1542. Their passion for the pure Gospel, thereby revived, was stimulated in 1636-7 by the spread of Laudianism over the Border; Canons and Prayer-book on the English model were issued for Scotland, without approval from the Scottish Church or Scottish Parliament. The nation revolted, seized the royal castles, and in the Solemn League and Covenant (1638) swore "in the great name of the Lord our reckless finish with bishops. But to abolish wanted Irremanded by the Church Assembly, therefore, with the composition of the Lords of proposed to the committee of Estates on her prosperity; he had heretofore relied for its subventions, he first Pacification, signed at wanted her Anglican broke down upon the con- the Scottish Presbyterial guarantees which events of 1641 showed safeguard her religion. of hatreds he had was test, the system of national machine

refused to function further, without a heart. The money asked from the City, in absence of Parliament, was refused, and could only be got from Catholics and clergy; the militia's ardour to tear down altars showed that sacerdotalism, not Scotland, was the popular enemy; Strafford's recall from Ireland, to take command at home, soon proved that he alone had kept Ireland tranquil. The Short Parliament, called on his advice in March 1640, refused supply till ship-money and arbitrary government were abandoned, and was quickly dissolved at the signs of its Scottish sympathies. Undeterred by this revelation of the public opinion, which for eleven years he had silenced, Charles pressed on with his "Bishops' war"; only the rout of his army on the Tyne and the Scots' occupation of Newcastle and Durham drove him to take the advice given by a Council of Peers to recall Parliament. In November the Long Parliament assembled, not for twenty years to be wholly dispersed.

Revolution, with a pall of feverish fears, hung over England for the next eighteen months; the Queen's appeals to Rome, army plots, Irish rebellion, dread of Catholic invasion, fact and magnified fiction, exciting Parliament and City, gave a handle to the skilful leadership of Pym and Hampden.

CHAPTER VIII

THE CIVIL WARS, 1642-9

THE character of Charles I, which so largely provoked war, did much to prolong it, and to ruin a cause which had in it many elements of strength. A King on the defensive during revolution may legitimately use weapons not commendable in times of peace, and it is idle to censure Charles for trying to play Presbyterians and Parliament against the Independent army. His fault, rather, was that incurable perversity of judgment, which made him prefer Henrietta's advice to Clarendon's, which led to moves behind the backs of his ministers, like Glamorgan's mission to the Catholic Irish, or hopeless combinations of English Cavaliers and Scottish presbyters. Nor could he judge a man; he conceived that Cromwell could be won by an earldom, and subordinated his best advisers, like Hertford or Hopton, to the peevish Rupert or the brutal Grenville. Yet, there was about him a fixity of principle which, when a prisoner and unaided, he wielded like

a weapon of steel. To break prison, he would make promises he would not keep, or juggle with soldiers who could break him like an egg-shell, but he would never extinguish by concession all hopes of recovering the Crown and the Church as received from his father. Here at least he defied the promptings of his wife, who urged him to win Scotland and half England by accepting Presbyterianism; between two heresies, this Catholic Queen preferred one commanding an immediate power of the sword. The King's decision which, with Laud's death on the scaffold, saved Anglicanism, was thus of vast import to later history, and his royal conviction, that revolution could never permanently prosper, hedged about with new divinity the idea of kingship and projected it forward for another thirty years.

Civil War England was not, as Henry VII's, a group of separate provinces and, thanks to a century of strong government and the printing press, no geographical line divided the parties. The ultra-royalist Duchy of Cornwall contained many Puritans; Puritan London and Essex produced Cavalier soldiers and conspirators. It is, broadly speaking, true that the trading classes were Puritan; since ports and industrial markets were more numerous south and east of a line taken from Hull to Southampton,

this area was predominantly Puritan, while North and West were the reverse. But economic and class divisions were no more rigid than geography, and it was never a struggle of rich against poor. Half the peerage did not support Charles, and at least half of the squires were Puritan. The war was feudal rather than social, if feudalism means the leadership of a recognized aristocracy. Parliament began by vowing to "live and die with the Earl of Essex," and Puritan Saye and Sele could raise Oxfordshire against the University, a Puritan Herbert led Wiltshire, a Cavalier Somerset the Welsh March.

But essentially men were fighting, less for men, class, or shire than for firmly-held views of law and religion. Diverse ideals had always been implicit in Renaissance and Reformation, and had branched further apart by force of events, or unnatural repression. The classical revival, which produced the despotic teaching of Italy and Roman law, had also discovered in Plutarch and Athens an idealized aristocratic republicanism; not only individual liberty, but the State's divine right, had come out of the Reformation. Educated Englishmen, long apprenticed by debate and printed controversy to these high notions, were divided into two parties by far more than material

interests. The wide ramifications of the Court, poetry and drama, the classic tradition, chivalry, mysticism, reverence for degree and order, all those catholic feelings which make men feel themselves part of an ancient country, a universal creed, or a great society,—such sentiments produced the Cavalier. On the other side were the lovers of personal liberty, whether it were based on law or abstractions—the traders, fanatics, common lawyers, classic republicans, and all those Protestant individualists who resented governmental centralization, hierarchy of rank, and cramping of the spirit by human ordinance. To antiquity the Puritans opposed energy, to honour truth, to sentiment reason, to the glory of warrior and song the aspirations of every humble seeker and finder.

But rigid lines between English parties are drawn less by statesmen than by historians, and in this most merciful of civil wars there were none. Many men of intellect or position entirely abstained; all went into it unwillingly, and the New Model army was half composed of conscripts. There were, of course, pure politicians like Shaftesbury or Holland, who crossed and recrossed from one side to the other, but there were also legal Puritans of the Selden type who hated sects, and Cavaliers

like Sunderland who disliked bishops. There were Anglian parsons who kept their parishes under a Presbyterian system, and ex-Cavaliers who joined the New Model. Finally, the wars were closed by Monk, who had served loyally in each camp. The margin, then, between the rivals was narrow and fluctuating; many families were divided, even the Cromwells; and in this "war without an enemy" (as the Puritan general Waller wrote to the Royalist Hopton) peace was never far away.

The grounds for the Puritans' overwhelming military victory could be predicted from a study of Elizabethan England. Their secure possession of London and the rich southern shires was half the battle. Two-thirds of English trade circulated from London, and there two-thirds of the customs were collected. The very spectacle of Parliament and law courts, sitting as of old at Westminster, seemed to put the onus of aggression on the King. The Inns of Courts were the real university of the lawyers who rejected prerogative; the City was the mother of an active Press, of a wealthy Presbyterianism, and of trained bands who formed the only exception to the undisciplined amateur soldiery of the day. With London and commerce went the fleet, which under its commanders, Northumberland and Warwick,

incorporated much of the Elizabethan Protestant spirit. By land Parliament held the inner military lines, by sea they commanded the circumference, and steadily crushed Royalist hopes of European assistance, and Royalist bases in Ireland and the Channel isles. Trade and the City enabled Parliament to pay and equip a regular army, while the Cavaliers scrambled for contributions from great magnates, Oxford college plate, or sale of Crown jewels.

But the greatest military asset of Parliament was Puritanism itself. Were they not the elect—"a people with a stamp set upon them by God," said Cromwell—"His people, who are the apple of His eye, for whom even Kings shall be reprov'd?" They had much to avenge. Eliot, dead in the Tower, and refused even burial in Cornwall,—“whose blood still cries for vengeance”; Prynne and Bastwick with their ears gone, exiles in America, godly preachers deprived, massacre in Ireland. But now the sword was in their hand. “O how comely it is,” wrote Milton years later,

“and how reviving
To the spirits of just men long oppressed,
When God into the hands of their deliverer
Puts invincible might
To quell the mighty of the earth, the oppressor.”

Now they could win that perfect reformation of which Elizabeth had robbed their fathers; the wild beast Strafford was trapped and slain, and Canterbury in the Tower. Religious democraey, long held under, foamed over in what Bossuet called "mille seetes bizarres,"—Independents, Fifth Monarchy men, and Quakers, Anabaptists, Socinians, or Ranters. Idealists and adventurers from New England, Henry Vane and Downing, returned to make their game in the revolution. A countless pamphlet literature vented the rights of men in a state of nature, human equality, and popular sovereignty. The Puritans' mental energy impressed their bitterest foes for more than a generation. Confident of their calling, they came from the plough or workshop to command armies and fleets; agriculture, economics, building, law, all felt the afflatus; Restoration England had still to submit to their intellectual lead. Of such material Oliver Cromwell, a Huntingdon squire, typical of hundreds in that age of noble blood but limited income, formed the army of the Eastern Associated counties; officered by gentlemen, picked without respect for religious orthodoxy, but Godfearing men of the sort Oliver preferred, "a plain russet-coated captain, who knows what he fights for, and loves what he knows."

But in the first three years of war such troops were rare, and the outcome consequently doubtful. Edgehill, the first serious battle (October 1642) was indecisive; disappointed in his first dash for London, Charles fell back on Oxford; for another year and more these two capitals, each the rallying-place of a Parliament, a civilization, and armies, disputed England with alternating success. The royal forces were dissipated in the country-house warfare congenial to too many of their magnates; the King's strategy of a triple advance upon London broke down on the refusal of the Cornish army to carry their triumph beyond Wiltshire, and in the failures to take Hull and Gloucester. Before Pym died he won the Scottish army to support Parliament; a high proportion of its officers had been trained in Continental war, while its leader, Leven, was a considerable general. The political price paid was high, for the league of September 1643 pledged England to Presbyterianism, but its military justification was seen in the greatest battle of the war, Marston Moor (July 1644), which delivered the North to Parliament. On the other hand, Essex was beaten in the West, Montrose was raising the Highlands in the Scots' rear, and a third year closed without a verdict.

Petty garrisons on opposite hills, provincial

levies, even of grouped counties, and skirmishes like that at Chalgrove, where Hampden was mortally wounded, could not decide the war. For this a regular army was needed, mobile, paid, and under unified command, and only Parliament had the means and fervour to make it. Pressed by Cromwell, the Committee of both Kingdoms, the liaison body for England and Scotland, recommended to Parliament the formation of a "New Model" army of 22,000 men; the commander was Fairfax, with powers of naming his officers, and Cromwell its lieutenant-general. At Naseby (June 1645) they destroyed the last considerable royal army. For a year longer Charles lived the life of a hunted partridge between Oxford, the Cotswolds, and Wales, but steadily the lines round him grew nearer, and in May 1646 he surrendered himself to the Scots, who already at Philiphaugh had disposed of Montrose. Oxford fell the next month; only the Scilly Isles, Jersey, and one or two Welsh castles still flew the royal flag.

Three summers more were to pass before the King's head was held up at Whitehall, to the rolling of drums that drowned the groans hailing the Commonwealth of England. The Revolution, like all revolutions, had fallen to pieces. More than discontent with ineffi-

ciency had caused the replacement of Essex and Manchester by Fairfax and Cromwell. They were "grandees," suspect of wishing to avoid the arbitrament of war, or the fall of monarchy. Most of all, the Puritans were divided by religion. A great majority in Parliament never intended to relax the "golden reins of discipline"; their Church, as they had argued under Elizabeth, was the true Church of England, purged of prelaey. Presbyterianism proper was not the ideal of the early leaders, Pym or Hampden, but military necessity brought them to it. The Westminster Assembly, set up in 1643, and soon reinforced by Scottish ministers, proposed the full presbyterian model, but the English common lawyers insisted on giving final powers to an Erastian body of parliamentary commissioners, and the Independents contested every inch. For, while Independency could only breathe in an air of toleration, the Presbyterians and their Scottish friends demanded the suppression of heresies. Intersectine war raged in the assembly, on the liberty of separate congregations, the powers of lay elders, exclusion from the Sacrament, and preaching of laymen, while each body of theologians looked for support to an army in the field.

The lull of peace gave Charles the chance of recovering what he had lost in war. The terms so far offered by the Presbyterian majority in Parliament, in the propositions of Uxbridge (1644) and Newcastle (1646), were impossible; he was asked to surrender the Church and militia, to transfer control of the executive, and to proscribe long lists of his best friends. But in February 1647 the Scots gave him up to the English, and a contest opened between Presbyterians and Independents for the control of his person; short of his death or deposition, for which few were yet prepared, the Crown's weight must tilt the scales. The ideals of Parliament were better than their methods. As a preliminary to peace, they were resolved to rid themselves of the dictatorship of soldiers, to disband the bulk of the New Model, and to form a new force for service in Ireland. But the pay they offered to the old army was miserably inadequate, and they proposed to officer the new by Presbyterians alone. Threatened with loss of temporal prospects and spiritual freedom, the army mutinied, and under the agitators, the elected delegates from each regiment, broke from the restraining influence of Cromwell and his son-in-law Ireton, who now had the alternative of abandoning their men, or of

guiding an army which was resisting the civil power.

Reluctantly, and impelled by their followers, the army commanders in June 1647 seized the King at Holmby and the artillery at Oxford, marched on London, purged Parliament of its most obnoxious Presbyterians, and in the "Hheads of the Proposals" produced their plan for a settlement. Mainly the work of Ireton, the Hheads resemble most nearly the solution gradually devised in the two next centuries; in effect, they would have subjected not only the King but a biennial parliament to new and representative constituencies, and have checked an uneoercive episcopal Church by general toleration for Protestants.

But this philosophic radicalism commanded adherence neither from King, Parliament, nor civilian Independents. Confronted by this all-powerful army, the first two naturally drew together, and for a year the King bargained to win those elements of moderate civilian support which would give best military and constitutional guarantees. Escaping from one captivity at Hampton Court to another at Carisbrooke, in December he signed the "Engagement" with the Scottish nobility. In return for Presbyterianism in Scotland and (for three years at least) in England, with

special concessions as to place and office for Scotsmen, the terms restored to Charles his command of the army, his choice of councillors, and royal veto; no toleration was to be given to Independents, or any sects. Once more Scottish theology imperilled the civil liberties of England, and from the Engagement sprang the second Civil War (May to September 1648).

In the military sense it was a promenade. Fairfax crushed the Royalists in Kent and Essex; Cromwell dealt with Presbyterian colonels in Wales and, with Lambert, broke Hamilton's straggling army of "Engagers" at Preston. Both staunch Presbyterians and loyal Cavaliers disliked this insincere alliance; the Independents, judging Presbyterians who joined it as men who sinned against the light, viewed the second war as infinitely baser than the first, being designed to "vassalize us to a foreign nation." In the army's absence, Parliament again approached the King, but with different programmes voiced by different sections. Holles implored him to concede Presbyterianism; even Vane, the Independents' ablest civil brain, to Cromwell's horror was "meddling with the accursed thing." A dour suspicion possessed the army, that they had been tricked into sin by negotiation with

Charles. Their council, before they set out to war, rang with denunciation: "We have gone about," said one orator, "to wash a blackamoor." Waves of fundamentals and natural rights broke on the devoted head of Ireton, who defended common law and private property. Before dispersing, the soldiers agreed to call to account, on their return, "that man of blood" Charles Stuart.

The mind of their leader moved slowly; he had taken little part in public life till he was over forty, and had lived much alone. He had stuck to Parliament while it offered a chance of settlement; he had deprecated the march on London, and warned extremists "that which you get by force is nothing." He was not, he admitted, "wedded or glued" to any form of government, though now, as always, he preferred something with monarchy in it. He would rather wait for the decision of "some extraordinary dispensation." As the campaign moved on, Providence bulked larger than ever in his heart. "Look at providences, they hang so together;" this army, the poor godly people raised by God, invincible. He would not rest on arguments of *salus populi*, but Providence beckoned the army on, forward to a real settlement of righteousness, not to any "ruining, hypocritical" treaty like

Parliament was making, in hopes of good faith from Charles; "good from this man, against whom God hath witnessed, and whom thou knowest!" When, therefore, the southern army called for the King's trial, Cromwell with the forces in the north approved. The soldiers demanded a dissolution of Parliament, but the Independent politicians were content with a purge, and in December the Commons, forcibly cleared of moderates, set up a High Court of Justice.

Convinced by the fate of some last approaches that Charles would never make final religious concessions, the Independent leaders resolved at last on the course urged, for a year past, by the rank and file. Of 135 commissioners appointed, only fifty-two appeared to try the King; the Lords' refusal to charge him with treason to the nation was brushed aside. Deaf to the pleas of the Prince of Wales and foreign powers, ignoring the objections of Fairfax and the moderates, resolutely, and in the light of day, this small group of fanatics tried the King for violating the limited power entrusted to him by the people. On the 30th January, 1649, Charles was executed, by no known law and a nameless executioner.

"Be not offended," wrote Cromwell later,

"at the manner of God's working; perhaps no other way was left." Perhaps not; but "that which you get by force is nothing."

The royal cause, thus crushed in England, still lingered in Ireland and Scotland, mingled in each with racial and religious forces formidable to the English army. The Irish wars had degenerated into cross-sections of creed, race, and barbarism, Popish Celts obeying a papal legate, loyal Catholics, royalist Protestants, Ulster Scots, English Puritans. Charles' gallant Deputy, Ormonde, obstructed by Papalists and defeated by Puritans, had run his course before Oliver landed at Dublin in August. In two campaigns the resistance of Catholic Ireland was broken, Cromwell showing by the massacres he allowed, at Drogheda and Wexford, the Puritan purpose to avenge the blood shed in 1641.

Kirk and army in Scotland were tougher antagonists. By ejecting the "Engagers" from their ranks, and by the execution of the Cavalier Montrose, they proved their intention to fight only for a Presbyterian King. Forced to play this unfamiliar rôle, the young Charles landed in June 1650 at Cromarty and accepted the Covenant, and the momentous possibility of restoration at the hands of a Scottish Presbyterian army faced the rulers of England.

The battle of Dunbar (3rd September), precipitated by the over-confidence of the Scots preachers, wiped out Leslie's army, and delivered the Lowlands into English hands. Efforts to win Scotland by negotiation, and Cromwell's illness, delayed further action till June 1651, when, determined to force a decision and avoid the strain of another winter's war, he advanced on the Highlands and seized Perth. He had thereby consciously risked opening for Charles the roads to the south; the "crowning mercy" of Worcester justified his confidence, for it destroyed the last royal army and closed the wars. After forty days of wandering in disguise, Charles reached the dangerous refuge of France.

CHAPTER IX

COMMONWEALTH AND PROTECTORATE

MILITANT Royalism was thus extinguished in all three kingdoms, and it was never Royalism, pure and simple, which endangered the Puritan victory. It was, rather, the intense conservatism which had half inspired the original outbreak—the clinging to common law, order, and continuity, against things new, arbitrary, or wild, whether dictated by a King, an army, or a priesthood.

The Commonwealth, as constituted without King or Lords, represented at most the feelings of one-fifth of the nation. Defeated Royalists and Presbyterians drew together in common detestation. The rump of the Long Parliament, twice purged and emptied by death, absence, and exile, represented nothing but itself. Since 1647 the army had called for its dissolution; beyond that they were divided, for some wished a new Parliament on the old plan, others an assembly of selected saints.

If a soul can be postulated of a revolution, it survives longest in the army that saves it. The Ironsides always refused to consider themselves mere mercenaries, and in various pronouncements of 1648-9 stated "fundamentals," which alone could satisfy the good cause. Religious toleration, a legislature chosen on a wide franchise and redistributed seats, these must be raised above the whim of parliaments. The war, too, had caused many evils that demanded speedy remedy. The arteries of trade were choked; the lands seized from Crown, Church, and Cavaliers were almost exhausted; the monthly assessments and excise, which financed the army, were heavy and unpopular. The law courts ceased to function; Chancery was clogged with thousands of cases. Litigation was ruinously expensive, and obstructed by obsolete procedure. Religion was still unsettled. Extremists set up the Word of God against Presbytery, which was the law of the land, and attacked the tithe system; Parliament itself sheltered too many of the ungodly, war profiteers whose "puritanism" was reduced to coal mines borrowed from the bishopric of Durham, leases bought at knock-down prices, official salaries, and army contracts. On top of all came the fratricidal war of 1652 against

Holland, a sister republic, postponing all hopes of reform and prosperity.

The legislators showed that they meant to perpetuate themselves by co-optation, and hence, pushed on by the Independent churches, Cromwell in April 1658 forcibly evicted them. The turn of the saints had come, and with "Barebones' Parliament" (April to December) revolutionary Puritanism reached its zenith. Named by Cromwell, who as General was the one conceivably legal power surviving, on recommendations from the congregations, this body of one hundred and forty were the select men of the cause. Their measures were radical, modern, and full of lofty aspiration; they abolished imprisonment of debtors, legalised civil marriage, reinstituted parish registers. But they suffered from the reformers' malady of unconstructiveness. If they destroyed Chancery, the need for equity would find another channel; they could, as their majority wished, abolish tithes, but a preaching ministry would still have to be fed. Their internal differences were ceaseless, and finally the more Cromwellian section surrendered their powers into the General's hand.

Parliament and the saints both having failed, the army had to make a constitution,

and the Council of Officers formed the "Instrument of Government" in December 1653, the first rigid type of constitution in English history. The powers of sovereignty were divided between three parties—Protector, Council of State, and a single-chamber Parliament. Security for all that the army held dear was assured by giving the sword to Protector and Council, by settling on them a fixed revenue sufficient for this and normal purposes, and most of all by making the whole Instrument, including guarantees for toleration, unalterable and fundamental. In other respects, it was an enlightened and honest scheme. Representation was diverted from rotten boroughs to counties, or to growing cities like Leeds and Manchester; the franchise was put on a uniform basis of personal wealth, which ignored tenures; members were summoned from Scotland and Ireland.

But neither neat mechanism nor real reform could close the breach between army and Parliament. The Commons, though chosen on a franchise debarring all Cavaliers, and deprived of a hundred members whom the Council prevented sitting, at once took up their historic claims. They pressed for sole financial powers, declined to except "damnable heresy" from their realm of legislation,

attacked an army command which was almost autonomous, and questioned the whole Constitution. In January 1655 they were dissolved. For eighteen months the Protector returned to governing through the Council of State, reinforcing it by his "little invention" of Major-Generals, eleven of whom administered for the Council an England divided into military provinces. This period of dictatorship was ended by the needs of war finance, and in September 1656 Oliver summoned his second Parliament. This appeal to public opinion revived the feud of civilian and military. The Commons refused to renew the decimation tax on Cavaliers, which financed the Major-Generals, and asked that the army should be superseded by the constitutional force, the militia. Legal opinion, working with moderate Cromwellians, brought forward the "Humble Petition and Advice," which proposed to restore not merely civilian supremacy, but the full privileges of Parliament, an Upper House, and hereditary monarchy. The Protector himself would plainly have preferred a legal crown to this perpetual sitting upon bayonets, but weeks of conferences showed the bitter republicanism of his old companions in arms, and he concluded that Providence had

"witnessed" against kingship. The new constitution, as finally accepted, gave him power to name his successor and restored a house of Peers; taken with the express provision made for freedom of speech and election, it made a long stride backward to the old forms of government.

The second session of 1657-8 proved that restoration of parliamentary liberties meant the end of Cromwellianism. Only the upper House now shielded army and Protector; he filled it, therefore, with his staunchest supporters, who were replaced in the Commons by the Presbyterians and Republicans previously excluded. Persistent attack on the powers of the "peers" threatened, then, government's very existence; after so many endeavours, Oliver dissolved his last Parliament in February 1658, with a "God judge between you and me."

He was resisting the free development of civilian England, whence he sprang, and his immunity from personal ambition only makes plainer the certain doom awaiting dictatorship. Every step he had taken since Naseby had only followed those of more dogmatic men. Reluctantly he had led them against Parliament, reluctantly taken supreme command from Fairfax. "God and the people,"

he claimed, had called him to this place; till they recalled that trust, he would rather be rolled into his grave with infamy than abandon it. But even if the voice of God and the people were the same, the "people" in his sense, by 1658, were narrowed down to a few thousand redecoats.

The title of his Government was revolutionary. Its very origin, the Instrument of Government, was the work of a military committee. English legal scruple became insistent; judges began to resign, merchants to refuse tonnage and poundage. The plain fact was that the Protectorate existed on sufferance; that a free parliament meant a majority of Presbyterians, concealed Royalists, and republicans. Manufacture of borough charters, purges of Parliament, and the use of English officers to "represent" Scotland and Ireland, showed sufficiently the Government's sense of its isolation.

The opposition might be grouped in four categories, two on the right, two on the left. On the far right, and least dangerous during Oliver's life, were the Cavaliers. Their best leaders were dead, or in exile. They were financially ruined, badly led, and factious. Old men, who clung to pure Royalism and believed in waiting for inevitable reaction,

hampered young men who asked for action and a Presbyterian alliance. The one rising of importance, that of 1655 in Wiltshire, was premature.

Far stronger was the Presbyterian and Independent aristocracy—nobles, squires, and lawyers. Some resented the rule of Prides, Hackers, and the rest of a new professional soldiery. Many detested the heresy of toleration; all revered the law and Parliament. Amongst them were the first war leaders, like Fairfax, Manchester, or Northumberland; the mass of the merchant class, weary of war and taxation; lawyers in large practice, even holding office, like the illustrious Matthew Hale. These were "the sober gentry," whom Monk later advised Richard Cromwell to humour, the necessary core of any seventeenth-century Government.

In the left centre were important disaffected Republicans. Vane, the idealist; Ludlow, a regicide who could not stomach a crowned general; Harrison, leader of the Fifth Monarchy fanatics; Haselrig, the toughest debater of the day; Lambert, a dangerous military rival. Beyond them came extremists of all coats and colours, Levellers and sectaries. With these last Oliver never attempted to compromise. He believed in

aristocracy, and shot Levellers for corrupting the army. Liberty of religion and property he held to be noble things, but both abused for "the patronizing of villainies." He had little sympathy with agitators who spoke of Saxon freedom and Norman servitude, or with Winstanley's "diggers," who chose Richmond Hill as the first site of a communist Eden. "Nothing but 'overturn, overturn;'" "Little better than beasts,"—such were Oliver's comments. This extreme joined in conspiracy with the other, the Cavaliers. Pamphlets instigated his assassination; as fast as Thurloe, the Secretary, unravelled one plot, another was begun. The Protector, with a pistol in his pocket, his own life-guard tampered with, London juries acquitting the frothy demagogues like Lilburne who attacked him, was the supreme victim to minority government.

This tension—a state of siege, political and moral—could hardly have endured longer, even had Oliver survived. There was war without; with Holland till 1654, with Spain in two continents, from 1655–9. Mixed motives of morality and police suppressed the drama, race-meetings, maypoles. Adultery was punishable with death, and swearing with heavy fines. A standing army of 55,000 men

policed a population of five millions. And if spiritual freedom in the wider sense was lost, religion itself was sunk in chaos. Tithes and private patronage still irregularly continued; three principal churches, Independents, Baptists, and Presbyterians, shared the parishes. Central control there was none, save in the old "Committee for plundered ministers," or fluctuating bodies of "triers" appointed by the Protector. There were many Vicars of Bray who slid from one church to another; many schemes for reunion, but no agreement.

After religion, the Puritan public wanted prosperous trade, but this, too, was lacking. Taxation was at a level undreamed of by Charles I. The "Humble Petition" settled £1,300,000 as the constant revenue, but expenditure in 1657-8 was $2\frac{1}{2}$ millions. The excise, copied from Holland, was hated and resisted. Loss of the Spanish trade hit the all-important cloth industry. Royalism troubled the American plantations. Faction in London and India disturbed rival East India companies.

Half of the Commonwealth's military force was engaged in garrisoning Ireland and Scotland. From the first of these no Restoration need be feared. All England was agreed on persecution, and Cromwell's settlement was

only the logical end of Tudor policy. As it was, the Rebellion and ensuing ten years cost Ireland some 600,000 lives; wolves reappeared round Dublin; slavers took captives to work in the Indies; trade was almost gone. The Settlement Act of 1652 transferred about two-thirds of the soil to some 40,000 new owners, either "adventurers" who had lent money in 1642 or Cromwellian soldiers, and offered to the evicted Catholics a choice between exile and Connaught. Over three hundred garrisons, successively commanded by Ireton, Ludlow, and the Protector's able son Henry, held down this poor colony; only in Scottish Ulster did any prosperity survive.

Presbyterianism in Scotland had not to fear this type of conquest. They were not Catholics and barbarians, but erring brethren: "I beseech you in the bowels of Christ," Oliver had written, "think it possible you may be mistaken." His constant overtures were not received by any, save a small group of interested officials. Religion and pride in a national monarchy forbade the Scots to obey a heretic usurper; conspiracy was unceasing, and only the presence of Monk, with a large army, stopped it maturing into war. Justice and prosperity were given to Scotland, but liberty denied.

There is one glory of civil and political

liberty, there is another of the ordered heroic State; and if freedom was stifled alike by Strafford and Cromwell, other things must determine our choice between two systems of "Thorough." When ten years later the Dutch were burning Chatham, when Louis XIV was selecting mistresses to inspire the policy of Charles II, Englishmen looked back to Oliver's days, as Frenchmen of 1820 to Tilsit and Marengo. This Government, narrow though its basis, was rich in character and ability. The Cromwells, Oliver and Henry, the admirals Blake, Penn, Monk, and Montague; Thurloe, the Secretary, with Milton and Marvell in his office; Hale, Ashley Cooper, Whitlocke, Lockhart—in every branch of public service an adaptable ability, an opening for the talents. Whatever else it added or took away, Puritanism gave tonic to the English mind. The Universities were filled with new intelligence; it was in this decade that the Royal society was born in Wren's circle at Oxford, that the Platonist theologians arose at Cambridge, that the literary instinct, long obsessed with theology, poured itself out in treatises of politics, economics, and medicine, that the three instruments of public opinion until the age of Anne—the newsletter, pamphlet, and coffee-house—first attained their strength.

Much of the Puritans' breadth of toleration, their spirit of improvement, was merged in the continued life of Restoration England; some disappeared, not wholly to be recaptured till the nineteenth century. Some illustration of their actual or projected legislation has been given; it is enough to add that it included diminution of capital punishment, abolition of copyhold, registry of land titles, cheap litigation, and other reforms which were still aspirations to the Utilitarians. Finally, strong though the front of politics was against its opponents, toleration was wider in practice than in law. A London Episcopalian could hear his service with impunity, unoffending Catholics were not persecuted, the Jews were allowed to trade and open a synagogue.

This last epoch of the English Reformation was neither inspired nor constrained by foreign influences. The Thirty Year' War turned after 1635 into a French-Swedish attack upon the Hapsburgs; it continued from 1648-59 as a duel between France and Spain, during four of which years France was crippled by the revolution of the Fronde. Neither Richelieu nor Mazarin dreamed of assisting the Stuarts, who were deprived of their last European ally in 1650 by the death of William II of Orange. The foreign policy of the Protector was almost uninfluenced by

internal vicissitudes, and linked up the continuous expansion of England from Elizabeth to Charles II. Religion, it is true, counted first with him. Spain was the "providential" enemy; he hoped for an Evangelical league of northern Europe; his alliance with France was conditional on a cessation of the massacre of the Vaudois. But in essentials he followed the traditional natural scheme of English alliance. Even his wish to win military points in Europe, like Dunkirk and Bremen, had Elizabethan parallels; his choice of France and Sweden for friends, his efforts at good relations with Holland and Portugal, coincided with the considered policy both of Burghley and Clarendon. The sea-war with the Dutch, terminated in 1654, was one of those tussles where neither opponent can reach the other in a vital part. England was hard-pressed financially, and her Colonies treating with the enemy; the carrying trade on which Holland depended for existence was temporarily ruined. Peace on these conditions could only be a truce. Dutch recognition of the English flag's supremacy in the narrow seas, and promises of compensation for damage in the East, broke down in unofficial feuds beyond each Government's control. English and Dutch East India companies were at each other's throats, complaints of Dutch

aggression on the fisheries, of Dutch abuse of contraband, nearly precipitated the second war which Charles II waged. Only mutual fear of the two dynasties, Stuart and Orange, bound the two republics together. Meanwhile Spain and France each bid high for the help of the veteran English army. Cromwell recommended his son to read Raleigh's "History of the World;" but colonial rivalry with Spain was not his reason for making the alliance of 1655 with Mazarin. In Spain he saw the capital of Popery, the centre of the Inquisition, the mistress of the vital Low Countries, the barrier to expanded trade. English regiments showed on the Flemish Dunes the fighting qualities proved at Marston Moor and Dunbar; Dunkirk and Mardyke were won and garrisoned. But the maritime war was haphazard and unhappy; only accident won Jamaica, the attack on the Spanish Main was a failure.

The lasting legacy of the Protectorate was the standing army and sea-power. Monk's regiments and the Dunkirk garrison formed the germ of the first; the sea commanders and administrators—Blake, Penn, Montague, Lawson, Vane, and Pepys—passed on to the next Government a solid tradition of naval organization, and a body of expert talent. Blake drove Rupert from the Tagus to piracy.

in the Indies, established the fleet in the Mediterranean, and repressed the Algerine corsairs. English sea-power intervened again in 1658-9 in the Baltic to prevent a Dutch trading monopoly and to save Sweden from extinction.

Oliver died on the 3rd September 1658, and his amiable eldest surviving son, Richard, succeeded. A few months showed that the soldiers, who made the basis of the Protectorate, had obeyed a general and not a family; by May they were asking an army command independent of the civil power, and compelled Richard to dissolve his Parliament. Now Oliver's "healing and settling" hand had gone, the component parts of Independency flew apart. Military "grandees" like Fleetwood, who had meant to keep a puppet Protector, were outbid by the preachers and the military democracy, who now forced Richard to resign and restored the Republic with the Rump. This antiquated and ridiculous survival did, after all, represent the civilian element which had waged the war against tyranny; with an obstinacy that was almost magnificent, they refused to give the soldiers sole control of military appointments, or the religious settlement they asked. In October the military group, led by Lambert, ejected the Rump and set up a Committee of Safety;

revolution had reached its invariable close, a blind-alley, for no more advance was possible, and retreat could only be led by anti-revolutionaries.

The Cheshire rising, led by Sir George Booth in August, revealed the discord dividing the Royalist and Presbyterian oppositions, and the glory of overthrowing Lambert's sheer military tyranny was due to the incurably civic temper of the Puritans. Not only Monk in Scotland, but the army in Ireland and the fleet declared for Parliament, which at the Christmas of 1659-60 recovered its authority. The passion for a legal settlement, once aroused, must go far beyond the Rump, and every step taken by Monk and his associates, to provide against a return of Lambert's army, insensibly led towards the old constitution. By the time he entered London with the Scottish troops in February, it was certain that only a new, freely elected Parliament could satisfy the nation; his readmission of the members secluded in 1648, whose last service then had been the treaty of Newport with Charles I, made restoration of Charles II almost sure. In March the Rump finally declared itself dissolved; in April the Convention Parliament was elected, with that Royalist-Presbyterian majority

which Cromwell had suppressed and which Monk represented.

If Monk made any restoration possible, restoration without conditions was mainly the work of Clarendon. Any specific pledges on religion, on title to land, or amnesty, must offend some section whom it was urgent to please, and conditions might be forced on Charles which would make him less than a doge of Venice. To Monk, therefore, to Fairfax, and the Puritan politicians full security was given for their personal and political reward, but the demand for limitations on the Crown and Church was met in the declaration of Breda by the formula with which Monk gone, "the military," subject to flew apart. "Military elected Parliament." Wood, who had met or actually, could Monk tector, were outbid the current he had released, military democracy, "on met on the 25th April to resign and restore with the King. the Rump. This antiyears of warring forces survival did, after all, and recovered her *via* element which had wach on the 29th May tyranny; with an obstin' entry into London, magnificent, they refused nor less the defeated sole control of military with a freely elected religious settlement they had begun; a freely the military group, led by victor at its close. the Rump and set up a Com.

CHAPTER X

CHARLES II

WHAT was demonstrated in 1660 was thus the inevitability of gradualness; what was restored was the normal development of the nation. Compromise was reached between the war's two strongest combatants, Royalists and moderate Puritans. The last time they had co-operated was in 1641, and the constitutional work of that year now stood unchallenged; "Thorough" was buried with Strafford; no more was heard of Star Chamber and ship-money. The Puritans kept the bulk of the lands they had won during the Commonwealth; they even kept, it will be seen, a general liberty of conscience. They had their full share of political power. Monk, Manchester, Morrice, Shaftesbury, sat in successive Cabinets. Scotland was ruled for two-thirds of the reign by the Presbyterian Lauderdale. The Hague Embassy was continued in Downing, Cromwell's American scoutmaster; the Paris Embassy went to

Holles, one of the "five members"; Montague, now become Lord Sandwich, led a group of former Puritans in command of the fleet. Two Puritan divines accepted bishoprics; many continued in the universities.

Continuity was stamped upon the Restoration, and the best testimony to the safety of peaceful Puritans comes from the house of Cromwell. The ex-Protector Richard lived unscathed to hear the news of Blenheim and Ramillies; his sister Lady Russell to meet the first Hanoverian. Freed from the bonds of war and fanaticism, the best energy of both parties was absorbed in activities of peace. The soldiers faded into ploughmen and artizans, the intelligence dedicated to the Gospel or artillery was harnessed to commerce and literature. Pilgrim and Worldly Wiseman marched in the plain together, undivided for the time being by the high pressure of ideals.

Of this new age, Charles II was no contemptible type. If neither politically nor privately a man of principle, he was at least a man of the modern world. He realized the limitations to his prerogative, and grasped that final authority could only be wielded through the Commons. He was more genuinely tolerant than nine-tenths of his

subjects. He liked a wild day at sea as much as Newmarket, and took a discerning interest in commerce, the Navy, and natural science. In the worst phases of his foreign policy he did not lose sight of British interests, just as in the worst company he kept the power of distinguishing good and evil. An ever-reinforced hevy of frail beauty squeezed Charles Stuart for grants, lands, and diamonds, but did not appreciably affect the King's policy. If from his grandfather, Henry of Navarre, he inherited this weakness, he had a flash also of his gift of Kingship, and bestowed more popularity on the Crown than any sovereign between Elizabeth and Victoria.

His reign may be divided into six stages. From his accession to the dissolution of the Convention in January 1661, the period winding up the revolution; the ministry of Clarendon and the supremacy of the Cavaliers, 1661-7; the King's personal government through the Cabal, 1667-78; Danby and the return to the Cavaliers, 1678-8; the Popish plot and anarchy, 1678-81; and a Royalist reaction, lasting to the close in 1685. But two things persist throughout, the monarchy and public opinion; throughout we are conscious that nothing of pre-Civil-War England has been restored, save the shell of the

This incorporation into national life of much of the Puritan revolution extended even to the Church. The character of wholesale persecution associated with Clarendon's code is a legend—that is, if contrasted with what had gone before. Like the Presbyterians before them, the Restoration Government, driven on by their supporters, legalized a persecution which in practice was mitigated. The King's wish for tolerance was notorious; political Puritanism was still much too powerful to alienate; Cabinet ministers and many justices refused to administer the persecuting statutes; it was only at moments of political frenzy that the Conventicle or Five Mile Acts were systematically applied. The growing tolerance of Protestants towards each other, implied in the circumstances of Restoration and vital in the interests of trade, was enhanced by their growing fear of Popery, even more by that scientific rationalizing spirit, which tokened the swift approach of the eighteenth century.

Mere conservatism could not cope with these conditions, and of this Clarendon's ministry is clear proof. Our debt to his work in 1660–1 must always be acknowledged, for he did most to turn partizan reaction into national compromise. The executions

clamoured for were limited to thirteen regicides, and Sir Henry Vane. The lands bought from Cavaliers, compelled to sell by the Commonwealth's crushing fines, were left in their purchasers' hands. The army was paid off and disbanded, and though Cromwellians shared in the plots and rumours that for ten years alarmed Government, the mass peacefully melted into civil life. The King's revenue was limited to £1,200,000, or less than the Protector's. Commonwealth judges were continued in office.

In all this Clarendon co-operated with the Convention. The religious settlement was more embarrassing. Episcopacy, hallowed by the death of Charles I and Laud, was bound to return; the surviving bishops of old days, like Juxon, were few, and the Churchmen's new leader was Sheldon, archbishop from 1668. Their policy was the clean slate; to wipe out the Commonwealth's work as usurpation, and restore the old establishment in every detail. Politically, this was out of the question. The King was a sceptic, leaning to Romanism as the best faith for monarchy; Clarendon a firm Anglican, but pledged to conciliation and fearful of renewing civil troubles. There is no reason to view as insincere the royal Declaration issued in

October 1660, which associated presbyters with bishops in ordination, and lightened the terms of subscription to the Articles. For it was accompanied by offers of bishoprics and deaneries to leading Dissenters and expressly declared to be provisional, in accordance with the pledge given at Breda, that final settlement should be left to Parliament.

In 1661-2 the whole Cavalier interest in the Commons made it clear that they would resist the King's concession. At the Savoy Conference the bishops refused to budge from their legal vantage-ground; by the Act of Uniformity the Commons proposed to expel all ministers not episcopally ordained. All amendments suggested by the King and Clarendon were rejected, and the first attempt in 1663, to give toleration by the prerogative had to be withdrawn before the Commons' wrath. The eviction of two thousand ministers was not followed by the disturbances Government had feared; the passing of the Conventicle, Corporation, and Five Mile Acts, completed the Commons' scheme for driving Puritans out of office, for suppressing their meetings, and depriving them of their preachers. But the passive resistance, which checked this persecution in practice, was winked at by the Crown, and Clarendon's

fall was brought about not by injured Puritans, but by King and Commons.

The Chancellor was an Elizabethan, prolonged into a new and naughty world. He believed in a balance of Crown and law; he would neither be a royal slave nor a parliamentary minister; if King and Parliament disagreed, somewhere in the books of the Inner Temple a solution could be found. The Council, composed of the great officers of state, should assist the King to govern; it was for them to execute the King's will (whether they agreed with it, or not), when it did not conflict with the law. The four hundred country gentlemen in the Commons had the sole right of voting taxes and making laws, but were not concerned with policy. From such a view of government, in the conditions after 1660, two results followed; bad administration, and quarrels with the legislature. The Council board was too cumbrous to control the specialized functions involved by modern war and finance; the Commons' voice created the money credit on which administration now depended, and could not be prevented from calling administration to account. Other reasons contributed, more creditable to Clarendon—the hatred of Lady Castlemaine, or Charles' weariness of business.

—but essentially he fell, because he ignored what even Charles saw could be ignored no longer, that the Commons were the spring of government.

The Cabal that replaced him included three men of first-rate ability: Arlington, the real minister for foreign affairs; Lauderdale, the despot of Scotland; and Shaftesbury, who was a power with the Commons and city. It was completed by the vicious, flashy Buckingham, whose Puritan marriage to a Fairfax was offset by sharing in Charles' lowest vices, and Clifford, a blustering Catholic Cavalier. If Clarendon outraged the Commons by his method of government, the Cabal collided with them on policy, and their fall is the clearest example of the King's ultimate subjection to Parliament. A Cabinet in the modern sense they were not, for personal struggles divided them, and in their one point of agreement, religious toleration, they differed from the Parliament through whom they had to govern. Their early efforts for religious comprehension were, therefore, promptly quashed, but a wider cause explains the collapse of 1673, their association in a scheme that included toleration for Catholics by the prerogative, and alliance with France for the ruin of Holland. In this, in the pro-

roguing of Parliament for two years, and in a stop on the Exchequer amounting to part repudiation of the national debt, all the ministers shared, but to two only, Clifford and Arlington, has been attributed the deeper guilt of connivance in a plot of the two Kings, for making a Catholic despotism in England through French arms. The sincerity of the King's brother, the Duke of York, and of Clifford in this may be accepted; that of Charles and Arlington is more obscure. Both were men of cold intelligence who, if Catholics, never practised their faith, and whatever Charles' approval of Catholicism, he never at other times showed a tendency to risk the main chance; Arlington's foreign policy as a whole was balanced, unmoral, but not Francophil. Careful examination of the secret treaty of Dover suggests that ample supplies of French money was what King and minister most desired; much earlier, poverty had driven Charles to beg loans from half the Powers of Europe, while schemes for military assistance in case of rebellion constantly figured in his negotiations. But, whatever the precise degree of guilt in the actors of the moment, the simultaneous declarations of war upon Holland and of Indulgence for all Dissenters defied both nation and consti-

tution, and when Parliament, early in 1673, was permitted to meet, it demolished these ministers. The passing of the Test Act drove York and Clifford to resign; Arlington quickly withdrew from the French alliance, and soon retreated in comfort as Lord Chamberlain; Shaftesbury made his peace with the Opposition. The Treaty of Westminster (February 1674) ended the English share in the war. Charles called on Danby and other Cavalier officials to save him from their friends and form a ministry.

Danby and Shaftesbury were the first party leaders. The first, by distribution of places, propaganda, choice of candidates, and bribery, built up a majority of Cavaliers, soon, when the Popish plot arose, to be styled Tories. Shaftesbury found a nucleus in the few remaining Puritans, like Marvell; adding to them any members he could detach from the "country" or middle group in Parliament, he created the Whigs, on a platform of no Popery, no pensionary Parliament, and no standing army.

Placating his Cavalier majority by repression of Nonconformity, Danby kept the royal favour by successful finance, and his hope was to combine King and Commons in war against France. But the conditions which at the

close of 1678 caused his downfall show the difficulties of a minister in transition between despotism and parliamentary monarchy. The parliamentary influence of the King, of the Duke (since his second marriage, to Mary of Modena, more fanatically Catholic), and even that of subjects like Arlington and Lauderdale, was still independent of the first Minister, whose tenure of office involved a precarious balancing of such personal forces with his own following in the Commons. Without clear parliamentary support he could not get Charles to make war, but war meant a standing army, which Parliament suspected would be used to establish Popery. Refused money by Parliament, the King would fall back on France; hence the secret treaties of 1677-8 with Louis XIV, which Charles ordered Danby to sign. An unholy alliance of Louis, his envoy at London, the English ambassador at Paris and the Whigs, sufficed, with the Popish plot, to destroy the one minister of Charles II who nearly achieved a Protestant war.

The Plot gave the Whigs a chance, which they so misused as temporarily to destroy their party; for this they had to thank Shaftesbury, whose brilliant political brain now descended to crime. No party had long retained his hectic ambition. He had fought

for both King and Parliament; since then he had been a Cromwellian peer, a minister under Clarendon, Chancellor in the Cabal, leader of Opposition to Danby. He had no religious bias, genuinely disliked persecution, and appreciated the best interests of trade. But, having once been ready to enforce toleration through the prerogative, he now planned the exclusion of York from the throne by perjury and violence. The Plot had, indeed, within it a substratum of truth, for the Jesuits had far-reaching notions of foreign assistance; but this could not excuse the use made of the "revelations" of Oates, Dangerfield, and other villains, to madden the people against all, guilty or innocent, who opposed the Whig majority in the Commons. From eviction of members, deprivation of judges, imprisonment of juries, they proceeded to attack the Queen, to proclaim the bastard Monmouth heir apparent, to organize the London mob, to attempt extension of "No Popery" to Ireland; and last, in 1682-3, to conspiracy for armed rebellion and the murder of the King. Proposals to limit, not wholly exclude, a Catholic successor, were rejected by three successive houses of Commons, and in 1681 the country was drifting into renewed civil war.

From this it was saved mainly by Charles' courage and tenacious judgment, which allowed violence to go on till it drove to his side all moderate opinion, headed by the eloquent "trimmer" Halifax. Using the same infamous weapons as Shaftesbury—packed juries, lying informers, and a poisoned press—he raised, none the less, a genuine Royalist revival. The Whig excesses reaped their nemesis in creating the Tories; the Church of England men Charles had so often offended rejoined him in 1681 as the sole hope of order against rebellion. From this date till his death, he called no Parliament. He divided his counsels between high-church loyalists like the younger Hydes, trimmers like Halifax, and officials like Sunderland and Godolphin. Relapsing into his constitutional indolence, he sank into political negation; French money saved him from Parliament, even if France were conquering the world; strong in the new loyalty of his people, he would not again tempt the deluge. His brother's title was accepted; Monmouth was in exile; Shaftesbury died at Amsterdam. Yet a King, who had spent life in learning from events and his own errors, could not have ignored the French threat indefinitely, nor indefinitely have dispensed with Parliam-

ment. Had he lived ten years, had he had a legitimate son, pressure of facts must once more have induced an understanding with his people; William III might never have reigned, Lord Macaulay's "History" have never been written.

It was lack of money and fear of internal sedition which first made Charles enter the gilded cage into which Louis XIV shepherded half the princes of Europe. But a subsidy is not the same as a dole; and not till his last years did Charles lose all English inspiration. National tradition triumphed over the prejudices acquired in exile, and friendship with France and Sweden, a settlement (even by war) with Holland, alliance with Portugal, were all inherited from Thurloe and Monk. Till 1670 at least the King's wish, on urgent financial grounds, was to avoid war. The sale of Dunkirk, on these grounds so desirable, and for strategical reasons approved by experts, was a further irritation to Spain, who grudged the loss of Jamaica and the Portuguese marriage. But English diplomacy was directed to closing the Spanish-Portuguese war, and would nurse both these nations against the menacing union of France and Holland. For by 1664 Louis' ambitions on the Spanish succession were declared, and a

Franco-Dutch partition of Belgium and Spanish trade was the nightmare haunting English ministers, which explains half the diplomatic vicissitudes of the reign.

The war with Holland, of 1664-7, was an episode external to this vital and delicate balance. Disliked by Charles and Clarendon, it was pushed on by powerful sections of the nation—by York and the seamen, by the East India and African Companies, by New England interests, and by diplomats of the Cromwellian school, who believed in *Delenda est Carthago*; to this, Charles' displeasure with the Dutch republicans, who excluded his ward, the young Orange, was entirely subordinate. Administrative corruption, parliamentary distrust, and unexpected disasters in the Plague and Fire of London, damaged the fighting qualities of the English fleet; the war closed with the scandal of the Dutch seizure of the Medway and the capital's outer defences. After three years of expensive and indecisive fighting, the peace of Breda (August 1667) established peace upon the *status quo* then existing; the net result for Britain being the addition of New York and New Jersey to her American colonies.

Of greater prospective importance was Louis XIV's attack in the same year upon

Flanders, followed by the Triple Alliance of January 1668 between England, Holland and Sweden, which forced him momentarily to be content with fortresses instead of provinces. But this alliance, glorified in retrospect as the beginning of opposition to France by the literary skill of William Temple its negotiator, must be reduced to its true perspective. Both Arlington and De Witt were waiting on events; England and Holland profoundly distrusted each other, but alike feared French aggression. Both made proposals for Belgian partition to France; both treated at Vienna and Madrid for an anti-French league. Arlington, with his Dutch wife, his Spanish training, and his linguistic gifts, was tactically one of the ablest of English foreign ministers, and the broad lines of his policy were ruled by more certain and creditable motives than truckling to Popery and despotism. Spanish bankruptcy, Austrian preoccupation with the Turks, and English poverty, really shipwrecked the formation of any coalition against France; that being so, and France being decided to attack Holland as the next step towards the Spanish Netherlands, Charles and Arlington made bid for a share in the French gains. This policy, unmoral but not unskilful, and more akin to Bolingbroke than

to James II, explains clauses in the secret negotiations of 1669-71, for the English acquisition of Sluys and Walcheren, of Ostend, Minorca, and Spanish America.

In 1673 Charles was compelled by Parliament to abandon a game which had misconceived both the English temper and the French power, and Danby returned to the anti-French policy of his friend Temple. His understanding with William of Orange, to make Charles join a European coalition, culminated in 1677 with William's marriage to James' daughter Mary, but the mutual distrust of King and Parliament destroyed the alliance, and Danby with it. For the next four years the Popish plot realized Louis' ideal, of an England crippled by internal disorder; for four more years again, Charles allowed France to master Europe by refusing to meet his Parliament.

Titles of affection, *pater patriae* and the like, are given to rulers who confer, or coincide with, an increased material wealth, and the England of Charles II was rich while the Crown was poor. Commerce had become the director of national policy. The City, great moneyed men like the Childs, Papillons, or Houblons, the East India Company, were powers comparable to the legislature; the

modern minister like Danby, or courtier like John Churehill, was deep in financial speculation. The Turkey company was charged with English interests in the Levant, and appointed the minister to the Porte. Much English capital was sunk in Mediterranean ports—Tangier, Aleppo, Alicante, and Leghorn; English consuls in all trading centres represented to the Secretary of State the effects of hostile tariffs, or new openings for English goods. The Customs revenue, which in 1604 had been estimated at £130,000, brought in over £500,000 in Charles' later years, and between Restoration and Revolution English shipbuilding was doubled.

The policy which protected this wealth was one of elastic and enlightened mercantilism. Export of bullion and the open door meant profits in the East, and from mere accumulation of treasure economists turned to watch the whole balance of national trade. Regulated and joint-stock companies were still the chief agency of commerce, but their monopoly was steadily being sapped by the pressure of interlopers seeking a free trade. But the outstanding feature of Restoration policy was that the Crown, for the first time, made colonial development the first charge on its resources, and welded the plantations

and factories, scattered over the globe by individuals and corporations, into something like an empire.

Charles I's flabby government had left Virginia, New England, and the West Indies to drift and separate at pleasure. The first effort at cohesion came with the Commonwealth, which included many men of colonial experience, and with the Navigation Act of 1651 bound the Colonies materially to the mother country. Charles II's ministers carried on these beginnings with greater energy. The effects of the Navigation Acts as a weapon against Holland are doubtful, but at least they consolidated the British monopoly in the plantations, and yet left freedom to the colonists in many staple trades. English dominion expanded rapidly on the north American seaboard. Charters to Rhode Island and Connecticut restricted mutinous Massachusetts; New York, New Jersey, and Delaware were won from the Dutch; Shaftesbury developed Carolina; Penn founded Pennsylvania; the Hudson's Bay Company opened up Rupert's Land and the far north; Surinam and Acadia were given up to Holland and France, but the consolidation of Jamaica, Newfoundland, Barbadoes, and the Leeward Islands more than made up this loss. Future

controversies—the validity and enforcement of the Navigation dues, and every claim of autonomy—were already heard, but in the Colonies as a whole self-government on the English model, local legislatures, and self-taxation, steadily matured. Fresh fields were opened by the acquisition of Tangier (abandoned in 1684) and Bombay, as part of the Queen's dowry, and by the African company's conquests on the Gold Coast. In spite of corruption and mercantile selfishness, Charles' colonial policy was perhaps the best branch of his government. He revived in various shapes his father's Committees for Trade and Plantations, in which some of the acutest men of the age, like Shaftesbury, Locke, or Evelyn, took a leading part; an unexpected amount of religious tolerance and constitutional breadth characterized their proceedings and the colonial charters. Colonial governors were often able, independent, and vigorous; an interest, financial, intellectual, or fashionable, in overseas ventures was almost universal in Restoration politicians.

In England the ruling class, who had defeated the central government in the Civil War, had no intention of suffering continuance of the Tudors' incessant paternal interference. Careful to avoid any taxation of land and

to guard themselves by tariffs from Irish competition, henceforward they passively resisted, or ignored, all attempts made to regulate prices, wages, or the taking of interest. The liberty aimed at and secured by the Puritans had begun with local self-government, and a long period now opened of absolute non-interference from Whitehall, whether with industrial relations or with the Justices' government in Quarter Sessions. New industries imported by Huguenots and other immigrants, the expansion of navigation and commerce, the survival of many yeoman farmers, and the close association of domestic industry with agriculture, all this checked, until late in the century, the harsher side of the new capitalism, and many local schemes were set on foot for the assistance of the poor. But the efforts of the legislature may be measured by the Act of Settlement (1662) which, preventing the mobility of labour in the supposed interests of London and the rich, kept poorer districts in their poverty. Increasing fluctuations of trade, a steady rate of enclosure, and the clear growth of a half-barbarous and neglected urban proletariat, were dire omens for the future.

The harm that could be done by the English aristocracy was proved in Ireland, which

only the Crown saved for the moment from the final enslavement brought about by Parliament in 1688. Acceptance of Cromwell's land settlement, even in slightly mellowed form, followed inevitably from English prejudice, but under Ormonde, Lord Deputy for most of the reign, Ireland enjoyed her last period of fair social and religious tolerance for a century. The worst feature, the commercial code that banned her export trades and her woollen industry, was passed by Shaftesbury and the English Commons against protests from Ormonde and Clarendon; only the royal government, too, stopped Shaftesbury's black project of a "Popish plot," to which Archbishop Plunket, Catholic primate of Ireland, fell an innocent victim. But the respite was to be short. Violence of extreme Catholics, rancour of Ulster, and English prejudice were currents which no personal influence could long arrest.

If Irishmen may think kindly of Charles, his Scottish government was infamous. The solid constitutional opinion, which checked him in England, here did not exist; feuds of Highlanders, moderate Presbyterians, and Covenanters, blended of old hereditary and moral hatreds, made possible the full scheme of *divide et impera*. Stuart detestation of

Presbytery was deepened in Charles by the handling he had received from the Kirk in 1650, and the execution of Argyle, its lay leader, signified his decision to fight it. The Scottish Parliament, in furious anti-Cromwellian reaction, swept away the whole work accomplished since 1633, and restored Episcopacy; between 1663 and 1679 sole power was committed to Lauderdale, nominally a Presbyterian, but in fact an ideal agent of Oriental despotism. Failing to conciliate Presbytery, he set out to crush it by savage punishment; jealous of all restraint, he alienated or drove into exile the best of the nobility. Scotland's open sympathy with the Dutch and with the English opposition instigated further repression, and a standing army, sole royal control of the Church, and a declaration of indulgence were sanctioned by a packed legislature. Rebellion in 1679 was put down by Englishmen and Highlanders; for the remainder of the reign the Duke of York, whom England would not stomach, rehearsed in Scotland the pains and penalties which England was soon to endure. The policy which drove Mary Queen of Scots into England thus returned upon Scotland a century later; her fate might have suggested that it is easier to uproot a sovereign than a nationality.

death of Russell, Sidney, and Essex could yet rouse hundreds, and desire for revival of parliamentary liberties stir thousands more. Sooner or later Louis XIV would come to grips again with the European coalition, and the choice be presented to England of siding in earnest with Protestantism or anti-Christ. Sooner or later Parliament must be recalled.

Nor could the constitution of 1660 survive unchanged for another generation. Despite all theories of passive obedience, Parliament had already questioned the remaining prerogatives which Charles so obstinately guarded—his discretionary supremacy over the Church, his control of foreign affairs, the sole command of the army. The Tory Danby's wish to attack France, the practical refusal of the ruling class to execute laws against Protestant Dissenters, the loathing of Roman Catholicism, proved by the Plot, and the penetration of the Church by liberal thought, were all signs that the "divine" authority of Church and King were being limited. It was reserved for King James (as three centuries earlier for Richard II) to defy the new order, and so to make short and sharp that revolution which would otherwise have come about by the steady erosion of time, or through the cynical ability of King Charles.

James was now in his fifty-second year, and had lived through the Civil War, the crisis of 1673, and the Plot without deriving any lesson save this, that only "firmness" could save government. His father, he thought, could have saved his head, his brother have crushed Holland, Catholicized England, and resisted Shaftesbury, had they only been "firm." Handed now in acclamation to the throne by a people sickened of mob-rule and conspiracy, he promised himself to carry through the firm policy he had preached, in and out of season, since his conversion in 1668—Catholicism and unrestricted royal authority. In private life he shared, in a dull, sordid way, in his predecessor's vices, but in quality as a public man he was much inferior. Long tenure of the Admiralty and Cabinet experience had given him love of the Navy and some habits of business, but he was bigoted beyond belief, implacable to enemies, and transparently disingenuous. On all questions of State except religion he vacillated perpetually, and in the crisis of the Revolution succumbed in a total nervous collapse, which only premature physical decay can excuse. The Stuart blood was, in fact, running thin, and of James' fifteen legitimate children eleven died in infancy.

Deluded by the atmosphere of the last four years, and convinced that others would, like himself, find the step short from Canterbury to Rome, James resolved first to attempt realization of his Catholic scheme through the channel of the Cavaliers. He placed their leaders, the Hydes, at the head of his ministry; Rochester, the younger but abler brother, became Treasurer, Clarendon Deputy of Ireland, their kinsman, Queensberry, Treasurer in Scotland. Of other prominent ministers, Halifax was removed to the honorific office of Lord President; Sunderland and Godolphin had both supported Exclusion, but could be counted upon to follow any ascendant policy. It will be noticed that the staunch Protestant Tory, Danby, was not included. A few preliminary severities, such as the whipping of Oates and the imprisonment of Baxter, the Dissenting leader, whetted the loyalty of extreme Tories, and the Court pressure used in the elections during May was hardly necessary to return a Tory House of Commons. They had scarcely voted James for life the revenues enjoyed by his brother when news came which redoubled their ardour; Argyle had landed in the Highlands, and Monmouth at Lyme Regis. Argyle's expedition, rent by faction among the leaders

and opposed by all the enemies of the Campbells, fell at the first blow; the failure of Monmouth is more significant.

It was not the beacon fire of 1688, but the last embers of Puritanism and the Exclusion plots. The aristocracy took up arms against Shaftesbury's pretender; Churchill, and countless others who fought James three years later, were still on his side. Orange had tried to stop Monmouth sailing, and sent the British troops in Holland to help the King. Only some surviving Cromwellians, some of Shaftesbury's Londoners, and staunch Puritans of Dorset and Somerset marched to the brief tragedy of Sedgemoor, where on the 6th July Feversham and the royal army cut them to pieces. The execution, nine days later, of "King Monmouth" raised not a ripple in political England. The King, with full national support, had crushed two rebellions within six months of his accession, and there seems little doubt but that wisdom and moderation would have enabled him to win every legitimate freedom for Catholics. But he asked for more than freedom, and of wisdom or moderation he was devoid.

Judge Jeffreys was sent to the West country, and over three hundred victims perished in the shambles of the "Bloody

Assize"; hundreds more were shipped to the Indies, or sold like cattle to courtiers and maids of honour. Cruel sentences on London Dissenters goaded Whigs to desperation, and shocked all men of humanity. James' approbation was marked by the elevation of drunken Jeffreys to the Cabinet, while the chief planks of the forthcoming session were signified by the dismissal of Halifax for resisting repeal of Habeas Corpus and the Test Act. Already the royal pledge to maintain the English Church was shamelessly violated. The King required his ministers to attend the Mass. A Papal nuncio was received in London, which was filled with Huguenots expelled from France by the revocation of the Edict of Nantes. Commissions in the army had been given to Catholics, and these faithful officers, James announced, he meant to retain.

Eleven days of November were enough to settle the religious question, so far as the Tory Parliament was concerned. They were asked to vote £1,200,000 for a standing army officered by Catholics; they offered £700,000, preferred the militia to an undisciplined and illegal army, and refused outright to repeal the Test. On the 20th November they were prorogued, not to meet again. Separated from his natural supporters, James moved on in the policy of "firmness" alone.

Not only Protestant England but Catholic Europe (excepting the interested instigator, Louis XIV) viewed "firmness" with dismay. English Catholics, mostly loyal Tories and still numerous, only asked freedom of worship. That great Pope, Innocent XI, advised caution; lawlessness could only bring nemesis, and he was outraged by French tyranny in Europe and the servitude of the French Church. Of the English ministers, only the heart of Sunderland (or more accurately, the brain) was in the business; he was ready to outbid his rival Rochester, even at the price of national safety. With him were associated the Queen, Mary of Modena, who had lost five children, but was still young, and passionately devoted to husband and Church; the Jesuit father, Petre; the Catholic Tyrconnel, so long the evil spirit of Ireland. This was the junto who now usurped the influence lost by Rochester, and under such auspices James proceeded to apply the policy of Mary Tudor, without a tithe of her constitutionalism, and after a lapse of a hundred and thirty years.

At first, he still hoped that the bulk of the "loyal" party would come to heel; he would assist the process by the full straining of his prerogative, and weaken resistance by installing a body of Papists in power. Like his father, he appealed to the judges against the

law, and packed the bench. By the test case of *Godden v. Hales*, he got a verdict that he could dispense with Acts of Parliament and, on the strength of this, placed Catholics in the Council and at the head of Oxford colleges. In July 1686 he set up an Ecclesiastical Commission, defying acts of 1641 and 1661 that had condemned all such courts. On Hounslow Heath he formed a standing camp of some 16,000 men, and the Mass was celebrated in their tents. The long business began of combing out Protestants from the army and commission of the peace. He committed the Scottish Council and Edinburgh Castle to Catholics; Tyrconnel became General in Ireland. Jesuits, whose very presence in England was illegal, worked openly in London chapels and schools. Lord Castlemaine's mission to Rome violated both English law and public decency; yet it failed in its main object, for the Pope refused to crown a hopeless policy by a cardinal's hat for the aspiring Petre.

In 1687, despairing of the Tory Churchmen, James turned towards the Protestant Dissenters, whom he had harried for twenty years in England and Scotland. If he could win them by the prospect of repealing the "Clarendon" code and the Test, he might

make a parliamentary coalition of Dissenters, Catholics and courtiers. The Hydes' dismissal in January marked the new method. The new Deputy was naturally Tyrconnel, who spoke openly of repealing the Settlement of 1662, the foundation of Protestant ascendancy on Irish soil. The Treasury vacated by Rochester was shared among five commissioners, of whom two were Catholics and one Godolphin. Purging was redoubled in central and local government; in countless personal interviews James pruned away his best adherents and his oldest friends. He displaced Admiral Herbert (who was to pilot the Dutch fleet in 1688) in favour of the Catholic Strickland. For London aldermen who had borne the brunt against Shaftesbury, he substituted violent Whig fanatics. In February, a declaration of Indulgence freed all Dissenters in Scotland from the penal laws; in April this was extended to England. At the same time James showed that he meant to cut the English Church at its roots, bidding the fellows of Magdalen elect a Catholic convert as President. Cambridge was tampered with in the same way; the two seminaries of the Anglican clergy were to be destroyed. Having thus forced illegality on court, army, Church, and corporate bodies, James dissolved the Parliament, so long

suspended, and turned to prepare the constituencies for its successor.

A committee of councillors began to "regulate" the boroughs; Lords-Lieutenant were ordered to sound every justice of the peace. The greatest magnates in England refused, like Derby, Oxford, or Shrewsbury; they were replaced by officials like Jeffreys or by avowed Papists. Nine-tenths of the justices would not pledge themselves to repeal the Test, or assist candidates so inclined, and these obsolete Tories were replaced by Dissenters. In August and September James progressed to Worcester, Chester, and Oxford, to countenance by his presence the new coalition; he heard Mass in public, greeted Dissenters warmly, and heaped reproaches on the false "Church of England loyalty." In spite of all disappointments, he did not mean to yield; if men resisted him, a beam of approval shone from heaven, for in December it was made public that the Queen was with child.

But James was old for his years; even if the male heir, so confidently predicted among Catholics, were born, there must almost certainly be a minority. Whether the child lived or died, the matter of succession or Regency must be settled. The present heir was Mary, Princess of Orange—staunchest of

Protestants herself, and in politics a mild, faithful reflection of her husband. It was the Princee whom English statesmen looked to as the real successor; his position as the inspiring centre against France made the condition of England a question for Europe. No coalition could prosper without including Holland; but Holland, with memories of 1672 in mind, could not attack France if England were French, hardly if England were neutral. From 1686 onwards everything tokened the approach of war. Since the Peace of Ninwegen in 1678, Louis' career had been one long aggression. By "reunions" in Alsace-Lorraine, he threatened the Empire. Through the person of Madame, wife of the Dauphin, he was staking out claims in the Palatinate. Cardinal Furstenburg, so long his agent in seducing German princees, was successor designate to the Electorate of Cologne, and since the Elector held the sees of Munster and Liege also, the military keys of Germany might any day be in French hands. German national feeling was aroused. The middle party, who had long vacillated, broke away from France and in 1686 formed the league of Augsburg with Austria. Protestants, among them speecially Brandenburg, were furious at the sufferings of the Huguenots; Catholics

could count upon the moral support of Rome, which would try to avenge in Cologne the wrongs Louis had inflicted in France and Italy.

But Louis' most brutal aggressions were never aimless, and the problem to which he had dedicated his life—the Spanish succession—was coming to a head. At the moment his chances seemed unfavourable. So far as the Spanish Court could be committed, it was so now to the claims of the Electress of Bavaria, daughter of the Emperor Leopold by his first Spanish wife. Much as Leopold would have preferred to sacrifice his daughter to his sons by a second marriage, he was anyhow decided to ~~an~~ French succession. Soon he could warmly, freed from his long Turkish warfare, “Church old lead his army to the Rhine or disappointment, breach was therefore imminent resisted he, or well, some of Louis' advisers from heaven, for came quickly? But James was of Spain.

male heir, so confios Orange were turned to Catholics, were boriesth, or to the morbid certainly be a minorit James II was pressing lived or died, the magland. He had a sort Regency must be settled of the ships he had was Mary, Princess of Orange ready to fight

France. But now he could think of nothing but the faith; for that, peace abroad was absolutely vital, for war would mean a Protestant Parliament. He would take no side in Europe. True, in 1685 he asked and obtained some French money, and refused to protest against their suppression of the Huguenots; but to active measures, to alliance with France, neither Louis nor his experienced ambassador Barillon could ever persuade him. This flickering spark of independence irritated the French, who finally abandoned a King on whom they could not depend. Still, for most of the reign, it was enough for France that King and Parliament were at daggers-drawn; it meant that England was a nullity in Europe, and that Louis could safely stop the pension which the more dangerous Charles had exacted.

Facts thus did not justify the Dutch conviction that England and France were bound by secret treaty, but in religion Louis had a weapon which gave an appearance of truth to this suspicion. Convinced from France that William was making an offensive Protestant alliance, James turned a deaf ear to the Dutch in every controversy, whether in the French seizure of Orange, the immunity given by Holland to British exiles like Burnet, or the

command of British troops in Dutch service. Moreover, William could not be passive where England was concerned. It was rumoured that James meant to press Catholicism on his second daughter Anne and her husband, and give them priority in the succession: even his failure would for William be nearly as disastrous as his success, for civil turmoil in England might result in a Commonwealth. On all grounds, then, he must achieve an understanding with the English; with the King, if possible, for the Crown's support was valuable in his struggle with the burghers of Amsterdam; if not, with the Opposition. Already, the Prussian Elector advised him to invade England; already Louis' minister at the Hague had predicted this must come.

James, who had himself so narrowly escaped exclusion, had no wish originally to exclude Mary and William. He loved his daughters, and was anxious to secure his infant Catholicism by agreement with his heirs, who might later have power to uproot it; the Opposition, who since 1680 had deferred to William's judgment, were eager for it now. These conditions attach great importance to the mission of Dykvelt, William's envoy, early in 1687. To James the message was, that the Prince and Princess, though

willing to give toleration, could in no circumstances agree to repeal the Test; not even for the reward of alliance against France. From Rochester and Danby, Halifax and Nottingham, Shrewsbury and Churchill, the envoy carried back messages of devotion; they did not (save perhaps Danby) speak yet of resistance, but let it be understood they were ready to join Orange in any remedy he proposed.

By the spring of 1688 the English were more pronounced. Some, like the wary Halifax, advised William that James made no progress; that his projected Parliament would never materialize, and that he would hang himself if given enough rope. But the more active—Danby, Shrewsbury, and Russell—feared that the people would hang before the King. "Regulators," selected sheriffs, new justices, might pack a House of Commons; new peers might flood the Lords; army and navy were being watered with Papists, and what legend said Strafford had tried with one Irish army, Tyrconnel might, in truth, accomplish with another. In April, therefore, they sent Russell over to ask when William could be ready to invade England.

The international situation was more critical than ever. Exasperated by William's firm-

ness, James in January demanded the return of the British battalions from Holland. On refusal, he began to prepare a fleet, and negotiated with France for assistance. The prospect of a British-French alliance, in defence of a Catholic settlement, roused the Dutch Calvinists, and finally converted them to William's scheme. In agreement with the States-general's leaders, he replied to the English rebels that, if invited by "the most valued" in the nation, he could be ready by late September. It will be noted that invasion was arranged before the trial of the seven bishops, or the birth of the Prince of Wales.

But only these two last events determined the character of the Revolution, turning it from precarious rebellion or invasion into a national defection from the Crown. The second declaration of Indulgence was issued in April; in May the clergy were bidden to read it in their churches. The refusal of Sancroft and his suffragans to obey united the country. Since five of the seven bishops were later Non-Jurors who refused to acknowledge William's title, it will be seen with what an effort the party of Divine right nerved itself to resist the Lord's anointed; as it was, by putting the bishops in the dock on a charge

of seditious libel, James finally destroyed passive obedience, and tore the Church apart from the Crown. Nor, in so doing, had he won the Dissenters, whose best leaders rejected his offers, and made plain their sympathy with the Churchmen. Neither the cheers of the royal troops, nor rejoicings in every village at the bishops' acquittal, stopped James; was he not (since the 10th June) father of a Prince of Wales? He continued to introduce Irish soldiers, dismissed two judges who had voted for the acquittal, and summoned the long-matured Parliament for November. When at last in mid-September he tried to turn back, he was months too late.

Side by side the English revolution and the European war rolled towards the brink, where they were to meet and surge over together. Popular disbelief in the genuineness of the new prince was general, but this was not the determining factor with the aristocracy who conducted this revolution. The final invitation to Orange, dated the 30th June, was signed by four Whigs (Shrewsbury, Devonshire, Henry Sidney, and Russell) and by three Tories (Danby, Bishop Compton of London, and Lumley). Before summer was over, they won the adherence of Anne and her husband,

of soldiers like Churchill, Trelawny, and Kirke; of magnates like Ormonde, Bath, and Lowther; of Charles II's son Grafton, and of two among the seven bishops. In September English nobles and gentry were gathering at the Hague: at home, court, army, and fleet were rotten with treason.

Treachery is hard to avoid or define during rebellion, but James' supporters later antedated the facts, and argued that he was led, by vile craft, to his ruin. Sunderland's career might, indeed, give colour to this theory. He was pocketing a French pension, while his wife, through Sidney, impressed her husband's merits upon Orange; in summer he attended the Mass, in December he was a refugee in Holland, by 1690 he was openly in William's favour. But ambition to be safe at any price, personal extravagance, and gambling debts seem to explain this base politician's game, and he may be cleared of intellectual perfidy at the cost of his heart. For he had quarrelled with Petre's section, advised against prosecuting the bishops, and (like Godolphin and Dartmouth) advised a speedy meeting of Parliament. It was on the advice of this moderate party that James tacked about on his course. He cancelled the Ecclesiastical Commission, restored the Magdalen Fellows, and gave back

a few town charters. But he still refused to meet Parliament, and all his steps were halting and insincere. Having alternately persecuted and petted Dissenters, he now tried to wheedle back the Anglicans, and attempted to separate the spiritual from the lay peers. In late October, overjoyed by reports of disaster to William's fleet, he dismissed Sunderland.

If a clear, candid course were needed at home, it was far more urgent abroad. In June the Elector of Cologne died. In August the French prepared to invade Germany. The same month Innocent XI pronounced against Furstenburg. In late September French troops seized Papal Avignon, and besieged the imperial city of Philipsburg. The stars in their courses fought for Orange, since these aggressions spared Holland the onslaught, freed his hands to invade England, and brought Catholic Europe to his side. Yet James helped the stars. Louis sent him warning after warning, offered him a French squadron, even hesitated whether, in England's interests, it were not better to attack Holland before Germany. James refused the ships, and declined to provoke Holland into war. Both sides asked for decision. The States-General intimated that conciliation in England was the prelude to peace in Europe: Louis, naturally

suspicious, left him (save for a little money) to fall alone.

We need not follow the stages in his doom. At the second attempt William sailed successfully, and on the 5th November landed, with 24,000 troops, in Torbay. Even now the King would neither negotiate nor summon Parliament. In Wiltshire, in his own presence, his army turned traitor. Simultaneously, risings broke out in North and Midlands, and Anne joined the rebels; the chief ports and arsenals, Portsmouth, Hull, and Newcastle, were surrendered or betrayed. All England clamoured for a free Protestant Parliament. The rising generation were allied with veterans; Dick Steele was riding in a troop of horse, Robert Harley was up in the West. But anti-foreign feeling was strong, and a resolute stand might have won fair compromise. James, who had been firm over-long, now suddenly collapsed. He named commissioners to negotiate, but meant throughout to fly; he feared his father's fate. Having sent the Queen and her infant to France some days earlier, on the 11th December, at three in the morning, he stole out of Whitehall and made for the Thames.

He had disposed of the great seal, burned the writs for Parliament, ordered Dartmouth

to take his loyal ships to Tyrconnel, and bade Feversham disband the army. He would neither defend his throne nor contribute to settlement. This was the end. Held up at Faversham, and brought back to London, he never intended to stay, nor did William mean to let him. The mass of English politicians did not mean it either. The Whigs had joined the invasion *en masse*, and were talking of a cession of the throne. The Tory Danby, now almost viceroy of the North, refused to accept James' messages; Halifax went over to the winning side. A strong London party pressed for drastic settlement. Even High-churchmen asked a free Parliament, and were ready to give Orange wide provisional powers. The King's first flight reduced London to two days of anarchy; in a real sense, he had "abdicated," and the settlement, whatever shape it might take, was thereby removed from his hands. The Dutch guards were already in St. James'.

"Frighted away," or of his free will, on the 23rd December James left Rochester, the last refuge he had himself selected, and on Christmas day landed in France, whither his Queen and Louis XIV had long beckoned him. Save from the deck of a French transport bound for Ireland, he was not to see England again.

CHAPTER XII

THE INTELLECTUAL BACKGROUND

THE human mind, which creates forms and institutions, is the last thing to be tamed by its creatures, and cannot be docketed in centuries. If no fixed date can be given for the "origin" of Renaissance, Cabinet, or domestic system of industry, more impossible is it to say, "Here ends the medieval, there begins the modern mind." The stuff of history is old, though re-dyed in new colours and shot with new schemes, and any English lives show the continuity of intellectual influence. Burghley, who was born in 1520 and must often have seen his grandfather, Henry VII's servant, was still minister when Ben Jonson wrote his first comedy; Jonson lived to know the Puritan lawyer Maynard who, as doyen of the Bar, welcomed William of Orange. If the Renaissance was the dawn of modern England, the full sun was long in rising, and its setting cannot be put earlier than Milton's death in 1674. Yet, a time does

come, marked rather by change of temperature than by gradations of darkness and light, when we feel the mass of Englishmen to be more like ourselves than like contemporaries of Colet and More.

What causes brought that change about have been suggested above—the classical revival, theological revolution, maritime discovery, change in money values, a new vision of the State. Whichever of these be taken as cause or effect, it is at least clear that the whole story was conditioned by immense increase of wealth and by the spread of printing; of these two, one certain consequence was increased education, which in its turn conditioned all else. It is possible that in pure learning medieval English doctors surpassed their posterity—that clerical and feminine education were better in the fifteenth than in the seventeenth century. But it is certain that education in the latter period was more widely ramified among the laity, and that learning was more closely linked than before, or since, to public affairs. The Tudors and James I were most learned of British sovereigns. Their teachers, Cheke, Ascham, or Buchanan, were eminent humanists. The proportion of scholars in high office can be judged from the lives of More, Bacon, and

Wotton, or later from Selden, Falkland, and Clarendon, Lauderdale, Temple, and Burnet. Anglicanism, which began with Cranmer and Jewel, produced prodigies of learning in Hooker, Usher, Jeremy Taylor, Pearson and Bull. The ratio of University graduates to population was probably larger than to-day; they were certainly drawn from a wider circle of schools. Royal interest in the Universities, abused to promote place-hunters or to censor literature, was seen at its best in new foundations and chairs. If the Reformation despoiled many old endowments, the century was prolific in new, such as those given to St. Paul's, Shrewsbury, Rugby, and Westminster schools; Busby at Westminster, as Mulcaster at the Merchant Taylor's, illustrate the hold of great schoolmasters over several generations. The printing-press, a luxury for humanists and nobles in Henry VII's day, was a familiar weapon of controversy to Walsingham and Peter Wentworth, and from the Civil War onwards became, in cheap pamphlets and newspapers, the creator of common opinion.

Yet the Middle Ages died hard, and a curious lull separates the "Utopia" and the "New Atlantis." It is true that a hair shirt is not incompatible with mental speculation; that

More's "Utopia," under the guise of a Platonic commonwealth, criticized the age for its lack of tolerance, its indiscriminate punishment, its warlike royalty. Yet More himself was medieval, and the *Civitas Dei* the background of his ideal; his friend Collet, interpreter of St. Paul, was not the last Dean of St. Paul's to be in advance of his age. Taken as a whole, literature in the first half of the century had scarcely advanced in motive upon that of the Yorkists. Apart from the foreigners who wrote lives of Henry VII, history was still of the chronicle type represented by Wriothesley, and no ardent Protestantism could lend critical gifts to Edward Hall, Henry VIII's London partizan. The study of institutions was virtually limited to legal abstracts, editions of the statutes, or treatises on the justice of the peace. Skelton, the satirist of Wolsey, or Elyot's "Governor," the mystery plays of Coventry, Latimer's sermons, all speak the language of the previous century, a native and naive English thought, with barely a veneer of Renaissance.

It is only in Henry VIII's last years, in the period of gloom that began about 1540 and stretched to 1570, that, with Ascham's appearance in prose and Surrey's in verse, the Renaissance seems to descend from the skies to

English streets, and move into its formative age. The humanism earlier borrowed from Italy, and taught in English Universities by the Dutch Erasmus or the Spaniard Vives, was transmitted now through Englishmen, but the direct influence of the classics and Continental letters was still overwhelming. Elizabethan translations perpetuated the great names of all nations in resplendent prose; North's "Plutarch" and Chapman's "Homer" have won most from immortality, but Tasso, Machiavelli, Commynes, Montaigne, or Calvin, became as familiar as the ancient world. The perfected sonnet of Sidney or Shakespeare sums up hundreds of experiments on French and Italian models; Ronsard and the Pleiade impressed the French lily on the English lyric; Spain was stamped on English drama. Lyly's Euphuism owed much to Castiglione; the Platonie ideal inspired Spenser; the cold morals and the warm imagery of Italy are seen in the aguish tragedy of Marlowe. Between 1580 and 1620 intellectual Europe was deeply cosmopolitan; giants of erudition on either side, Bellarmine or Baronius for the Catholics, Scaliger or the Casaubons for Protestants, contested the world's future, in an arena thronged by all the learned of Europe.

In England, as elsewhere, the secondary but most lasting effect of the Renaissance was that pride of country and native tongue, which all nations in renaissance experience. It ranged from the reasoned decision of scholars like Ascham to write in English, to the ballad cycles of Robin Hood, the rude plays built round persons so dubious as King Arthur or Jane Shore, or the patriotic drama produced by the Armada. Chroniclers like Holingshed, who gave Shakespeare his raw material, were followed by a long line of antiquaries in Bale, Lambarde, or Leland, by citizens of no mean city, of whom John Stow is the abiding type; finally by the finished work of Camden, of Bacon's "Henry VII" or Knolles' "History of the Turks," which superseded chronicle by a critical, comparative, narrative. Accompanying this conscious patriotism was that Renaissance quality instilled by all humanists from the Italians to Sidney or Hakluyt, the wedding of letters to action. Sidney's death in battle at Zutphen could be matched by Donne's experience at Cadiz, or Lodge's in the Straits of Magellan; his teaching echoes Elyot and Ascham, who bade Englishmen learn Greek and stick to the bow. The diverse learning dedicated to Elizabeth or Essex was meant to have a real application; the art of living, or of ruling

men, was not held to be different in kind from that of the epic. In this sense all Renaissance art was didactic, and Raleigh and Milton alike men of action.

Causes for the sudden upspringing of literature in a nation appear to defy prosaic analysis. But the century's new discoveries, of letters and creeds, of men and continents, fell in England on a people exceptional in national unity, deeply aristocratic, predominantly rural, more tuneful than æsthetic. Of these conditions the twin harvest was lyric and drama, an unequalled development, in one people at one time, of intellect and passion. For one generation the soil, fertilized by peace, wealth, knowledge, and achievement, seemed to blossom as without labour; innumerable anthologies of songs, pages of detached beauty in the worst dramatists, show a fertility of excellence more explicable by nature than by art.

Fifteenth-century art and music in England had gone hand in hand with an admirable lyric gift, found in all districts, in cities and monasteries, and the flood of poetry after 1580 is not so new in inspiration as in volume, subtlety, and mastery of form. Elizabethan lyric had more continuous connection than the drama with old England, and it sprang in profusion from every corner of society. Shakespeare's

songs do not surpass in art the best work of a score of others—of Lodge, Fletcher, Campion, Carew, or the anonymous authors of the song-books; all alike have the same fancy of heart and head, the veracity to nature which we associate with the clear-cut distance of early morning.

The body of Elizabethan drama, which may be said to begin in 1590 with Marlowe and to end with Massinger at the Civil war, is itself enough to mark that the Middle Ages have gone. Both chronicle play and ballads, Henry V and Agincourt, keep a connection of subject with older days, but the spirit they contain is new. The moralities which the Church had taught, or allowed to be dramatized, are departed; their knell is rung by Marlowe's "thirst for unrighteousness." Man, like Faustus, makes his own hell. Warfare from rediscovered ancient worlds, "to ride in triumph through Persepolis," a longing for strange new seas, the Bermoothes and all the elements conquerable by man, all this transported the narrow stage of the Rose or the Globe. This unmoral energy, which overturns worlds in Marlowe, descended to Ford and Webster, and makes wearisome the Spanish tragedies, the woes of Hecuba, the lust and incest, which fed with strong meat the

groundlings jaded by lions at the Tower. Only Shakespeare's mature work provided a divine comedy of human life, built on foundations which would outlast any one generation. The problems round "Lear," "Hamlet," or "Othello," the moral issues raised in the "Tempest" or "Measure for Measure," have pierced the theological horizons of the Middle Ages. His stage is the whole universe of thought rediscovered by the Renaissance; his drama, like the Arminian movement or the new political theory, deduced the scheme of life from human character and its freedom of will, and made man, Bacon's "servant and interpreter of nature," the often unhappy but not inglorious agent of a Divine plan.

Representing, as in Greece, the rule of a capital over a commonwealth of artizans and peasants, the drama is the best expression of the many elements that made Elizabeth's kingdom. Its special patrons were the Court and the nobles, and at high festivals, till the Civil War, the Court's amusement continued to be the masque, on which Henry VIII spent so much money and capering. A fantastic blend of legend and chivalry, abstract charities and virtues, and the Arcadian woodlands which furnished the loves and sports of kings, engaged the talent of Jonson and his tribe of

Inigo Jones and Henry Lawes; Leicester, Buckhurst, Southampton, and other magnates, financed dramatic companies. Protests from Puritan aldermen were crushed by powerful patrons and popular demand; the players' trumpets drowned the bells calling the godly to prayer. Considerable fortunes left by actor-managers, by Alleyn, founder of Dulwich College, or Shakespeare himself, testify to the numbers who made the play their chief recreation. Touring companies were welcomed not only by small English towns but in foreign courts, at Elsinore or on the coast of Bohemia. Not only classical or British mythology, but contemporary politics, became material for the drama. Essex challenged the Queen with a performance of *Richard II*; the Puritans and the Pilgrim Fathers were brought on the stage, before the deluge. An active university drama linked classical education to modern life, and protracted every royal visit. The scope of dramatic talent could be illustrated in the lyric gift and grace of Beaumont and Fletcher, by the tragic power of Ford, the popular comedies of Dekker, Heywood, or Marston; it lasted till the Civil War and beyond it, with Cartwright and Shirley. Shakespeare's effortless superiority as poet and craftsman crowns the romantic drama,

and summarizes like none since Dante all the hopes and aspirations of an age. The tremendous forces of death and nature that beset Lear, or make Caliban, no more exhaust this universal mind than plain men's conversations in Warwickshire and Cotswolds, or that analysis of love and company with which his women make delightful the Renaissance. Familiar quotation and ceaseless production of his plays in his lifetime, the applause of Kings, fellow-artists, and City audiences—this at least must vindicate the taste of the Elizabethans.

With his death in 1616, the mirror he held up to nature, the equilibrium and *élan* of that sane generation, may be said to have broken. Jonson and Donne, the two greatest survivors, would suggest it. Both were bred Catholics; both reacted against the spontaneous, satisfied Protestant England of their youth. Bacon's rather facile optimism failed to content the coming age. Jonson stigmatized the monstrous extravagance, the flabby humours that marked a romantic movement in decline, and returning to classical forms breathed much of the classic contempt for the crimes and follies that make up the history of man. Donne's satires spiritualized the feuds, harpies, and utopias which Dekker and others painted in

gross colours from the new growing London. In Donne intellect and passion are no longer in agreement, but at war. Like Falkland, he travelled far to find truth, and found her only in the cragged hills; there he wrestled and would not let her go, until she blessed him. The "metaphysical" school of whom he was the chief turned in upon themselves, or their destiny, the Elizabethans' dissecting power, and poetry became a spiritual anatomy.

A wind of many doctrines released by the Reformation was, in short, buffeting the mind of the early seventeenth century. Protestant individualism was haunted by Catholic revival, classical morality jostled with mysticism and new science. In some, like Carew, Suckling, or Herrick, a Latin paganism triumphed; the singing gift went on, but honour became illusion, ideals a weariness, and a carven skull sits beside the laughing loves. Falkland and Sir Thomas Browne, absorbing all knowledge, fell back on dreams or the Catholic faith of intellectual second childhood—*credo ut intelligam*. Catholic teaching, Spanish models, disgust with a Calvinism almost non-thinking, drove a host of fine minds to poetic Laudianism, and the "divine" school of Herbert, Vaughan, and Crashaw lent fervour to the cause for which the Gorings or the Wilmots

drew their fleshly sword. A common sense of disillusion, a wish to rest in something ancient and assured, whether Catholic or natural, a distrust of Bible theology and mob-law—all this cast a not ignoble shadow over English letters under the second Stuart.

On the other half of this revolving orb the planets of Renaissance and Reformation blazed for a last time brightly in Milton, in whom (as in lesser men like Hutchinson or Marvell) learning, Puritanism, and passionate love of freedom still created the universals of the true Elizabethan. It is true that an acrid period of twenty years' pamphleteering separated the first grace of "Comus" and "Lycidas" from "Paradise Lost" and "Samson Agonistes,"—twenty years, in which all that Milton lived for triumphed, only to perish. Yet "Paradise Lost" has that universal scheme, that reduction of all things to one, that amalgam of religion and knowledge, which is Elizabethan, if not medieval, and disappears with the compartments that, in modern life, wall poetry off from the everyday life of society. The last of the Puritans was also the last English humanist; Renaissance and Reformation died, as they were born, together.

Not unfittingly, in this age of growing

precision, English prose attained its final form. Shedding the imported pedantries of Euphuism, it long kept the music, colour, and "shoots of everlastingness" that livened Elizabethan verse, and in the Authorised Version, in Burton's "Anatomy," in Donne's sermons, or in Browne, displayed the depth of English speech. In the prose of the middle period, Jeremy Taylor or Clarendon, lingers some of this grandeur of earlier days, but Fuller's conceits, or Walton's pathos, strike us as archaic, and the admirable candour and clarity of Cowley more truly anticipates the Restoration.

French supremacy in European culture, the perfection of its lissom and effective language, the triumph of reason over divinity and passion, a conscious imitation of classic forms, all this produced the prose and poetry of Waller and Denham, Dryden, Sprat, Temple, and Halifax—to make that instrument which Addison, Swift, and Pope employed to curb both dullness and originality. Increasing differentiation of classes inevitably assisted separation in taste and humour; Shakespeare's or Dekker's wit was written down as unbecoming the gentry; the "Tempest" was remodelled by Davenant, the "Canterbury Tales" by Dryden, to please a more classic taste and sophisticated gentility.

True, a heroic drama made various fortunes for Nell Gwyn or Dryden, but this was not the characteristic product of an age of common sense. New social conditions, rationalism, and literary convention, tended rather to polished lyric verse, political satire, essay, and the comedy of manners; in all but the last Dryden was supreme—a literary dictator like none till Samuel Johnson. His opportunist temper fitted that generation like a glove; with masculine fearlessness he demonstrated that the language, like the Sabbath, was made for man, and not the converse; that plain diction had its own strength. A dozen others—Rochester, Roscommon, Sedley, or Dorset—turned out good examples of the cool lyric which Waller had made the fashion. Dryden's epistles were matched by the transparent and winning prose in which Sprat wrote the story of the Royal Society, or Halifax "The Trimmer." Incidental literature, like pamphlets of L'Estrange and Marvell, Shaftesbury's fragment of autobiography, the rich plainness of Bunyan or Burnet, show the gain in directness and argumentation since the days of Bacon, or those of the early Hobbes.

Political satire, familiar in ballad and broadsheet, was highly developed by a generation bred upon Horace, Juvenal, and Lucian,

and desirous to turn by rapid strokes the opinion of a small but interested audience. The rude vigour of Civil War satirists like Cleveland was polished in Butler's "Hudibras," or Marvell's scathing verses against the Court; in "Absalom and Achitophel," "the Medal," and "The Hind and the Panther," Dryden carried the art as far as English can go.

The historical writing of this century (often published much later), whether full-dress narrative, memoir, or collections, showed a great advance upon Bacon's standards. Herbert of Cherbury's "Henry VIII," Clarendon's "Rebellion," or Burnet in his "Reformation" and "History of My Own Time," manifest a consciousness that even pronounced views need support from documents and real material. This was provided for them by men like Rushworth, by owners of libraries like Cotton, booksellers like Thomason, or chroniclers like Phillips. Personal papers, as the diaries of Pepys or Reresby, Roger North's lives of his brothers, or Temple's memoirs, are examples only of a great mass, showing a sympathy with character, wide intellectual interest, and a sense of the complexity of government, which were common to many English men of affairs. The papers

of Lady Russell, of Dorothy Osborne, Mary Rich, or Mrs. Hutchinson, prove that educated women had not all died with Elizabeth; the libraries and correspondence of innumerable county families, that it is unsafe to generalize from London playwrights as to the barbarous illiteracy of the squires.

No change was greater or more rapid than in the method and conception of philosophy and natural science. In spite of Tudor creations like the college of Physicians, of pioneers like William Gilbert and virtuosos like Bacon, astrology and witchcraft troubled the Stuart theologians and judges, and it was not till the middle of the century that an advance in force began. Then Thomas Hobbes published the speculations he had discussed with Descartes and Gassendi; Wren, Ward, and Petty founded the Royal Society; Harvey and Sydenham began a long line of famous doctors. After the Restoration the names of Boyle, Isaac Newton, Halley, Flamsteed, Ray, or Cumberland, even the presence on the bishops' bench of Wilkins and Seth Ward, may testify to the wealth of this new learning, and to the fresh standpoint from which the structure and dynamics of life were judged.

This revolution, so clear in letters and science, transformed also men's thinking about

the State. There are, it is true, a line of typically English writers, from the Lancastrian Fortescue to Elizabeth's secretary, Thomas Smith, or the royalist Clarendon, who, perhaps, best represent average opinion, for the very reason that they professed facts more than principles, and historical rather than rational grounds for political obedience. Such men agreed upon the Crown's supremacy in the State, and its divinely-ordered rule, but declared it limited by law—whether by God's law that binds a good ruler, or by natural reason, or by the common law and statute, embodying the King's voluntary concessions. The rôle of this moderate but pragmatic school in politics was useful, yet indecisive, for it has been seen that sixteenth-century conditions asked, and evoked, more clear-cut ideas of sovereignty. Ultimately from its religious and political warfare two rival principles emerged—the divinity of the King, and the sovereignty of the people. Each had its cross-currents and qualifications; for the first could be watered down to the sanctity of order, the second construed as the rule of aristocracy. The law and theology dominating that age were susceptible of many interpretations; an appeal to nature might end either in acceptance of kingship as the survival of the

fittest, or in the natural equality of all men. But whatever the rendering of the faith, under these two heads can be brought all the political theory of the century and a half that followed Luther. Of the two, the liberal conclusion that the sovereign is limited, flowed more naturally from medieval precept and practice. The habitual teaching of Catholicism, that the State is subordinate to the higher law which the Church interprets, was eagerly taken up alike by Jesuit and Presbyterian, while Selden and Halifax could have discovered warrant for their notion of limited monarchy in Bracton, or the "Song of Lewes." In this camp, too, must be reckoned the illustrious Hooker, who assumed that the State rested on a contract, incorporating "the grand mandates of morality." But the most significant exponents of this new literature reached a medieval conclusion by a modern route, postulating not so much the majesty of God seen in the law of His Church, as the majesty of the equal rights of man. From this intense individualism sprang the Commonwealth. Levellers' demand for the power of the community; its root was disclosed as the century wore out in the individualist mediocrity of John Locke.

Practical politics create English political

thought, and the radicalism of the Commonwealth men from Edward VI's time onwards impelled the State Church to formulate its defensive theory of the divine right of kings. Compared with this, the influence of the Roman law and the civilians, of Machiavelli or the Italians familiar to Thomas Cromwell and Bacon, was as slight as that of Aristotle's regimental view of society. The Church's homilies, making rebellion the sin of witchcraft, had primarily in mind those who, in God's name, challenged the existing order. On the Continent the penalty of anarchy had received such fearful illustration that this theory of passive obedience played for a season a valid part in history, and Scriptural renderings of liberty were so conflicting, that it was as well that St. Paul had taught un-deviating obedience to the powers that be. The Apostle's lesson was pushed by Hobbes, the acutest thinker of the age, to lengths undreamed of by Anglicans, and placed on a basis that would justify the rule of a heretic or usurper. Yet, omitting his derisory use of the contract forming the State, and his view of a mechanical selfish fearfulness as the motive of society, Hobbes stressed, as none had before, the two points which Strafford and the Commons had arrived at in practical

politics—power as the sanction of law, and the necessary unity of ruler and ruled. His unorthodox foundations scandalized a devout age, and his immediate successors, the Cavalier Filmer or the republican Sidney, made little advance on the old rivals of passive obedience and the original contract. The shock of Charles I's execution and the war gave new life to the first; the Whigs, infuriated by James II, repeated the other, which in the Bill of Rights became the official theory of 1688.

But Hobbes himself mellowed despotic teaching by making room for utility as the test of institutions, and admitted that obedience could be withdrawn from a sovereign beaten in the field. Divine right, too, as read in that century, had its limitations; Anglicans were pledged to obey rather the *de facto* ruler than legitimism, while Filmer made Nature, not Scripture, the ground of paternal authority. These were the first straws blown on a mighty wind, unsettling the fixed altars of earlier theory. The sanction of institutions was henceforth rather their existence than their righteousness, their conformity to nature more than their descent from heaven, their result and working instead of their origin. The "fundamental" laws of God and man were

to be rewritten in the terms of changing human experience.

The two centuries, which had undergone such change and passion, ended on this note of moderation; in Dryden, Tillotson, and Locke, experimental philosophy, and the newspaper, and after Latimer, Drake, or Strafford it may seem a bathos. Yet a country pays, after all, for unrestrained ideals, and a Bank of England makes a better terminus than a Bastille. In the hundred years that began with Elizabeth most of the solid achievements of our race received their impetus; three-quarters of the seventeenth century were spent in impressing on Elizabethan vitality the forms and conventions which must perpetuate both *imperium et libertas*. In the building of their manor-houses, as in the structure of their government or their prose, we may see, not unreasonably, that rhythm resting in restraint, which marks in this strong generation a rare balance of man and master, emotion and intelligence, nature and art.

BIBLIOGRAPHY

(The original note has been amended in some particulars for the reprint of 1942; some works published since 1927 are now included.)

FIVE great historians have covered most of the period: *Clarendon*, "History of the Rebellion" (specially Vol. I) is much of it genuinely contemporary; *Froude*, "History of England" (at its best in dealing with Elizabeth), and some of the "Short Studies"; *Ranke*, "History of England," which begins in detail at 1625 and is specially valuable for foreign affairs; *Gardiner*, "History of England, 1603-42," "Great Civil War," and "Commonwealth and Protectorate"; *Macaulay*, "History of England," for the Revolution.

The modern scholarship, which corrects and supplements these pioneers, may be illustrated as follows:—

A. For the Tudor Period. *Busch*, "Henry VII"; *Pollard*, "Political History of England, 1547-1603," and his biographies of Henry VIII and Wolsey; *Pickthorn*, "Early Tudor Government"; *Chambers*, "Thomas More"; *Merriman*, "Thomas Cromwell"; *Dixon*, "History of the Church of England" and *Frere's* volume (1558-1603) in *Stephens and Hunt*, "History of the Church of England"; *J. E. Neale*, "Queen Elizabeth"; *Read*, "Walsingham," and *J. A. Williamson*, "The Age of Drake," for aspects of Elizabethan foreign policy; *Cheyney*, "History of England from the Defeat of the Armada," and *Notestein*, "Winning of the Initiative by the House of Commons," are specially useful for parliamentary development and institutions.

B. The Stuarts. Two volumes of the Oxford History, *G. Davies*, "The Early Stuarts," and *G. N. Clark*, "The Later Stuarts"; and *G. M. Trevelyan*, "England Under the Stuarts," for the whole century. For the Protectorate period, many works and articles of *Sir Charles Firth*; notably "Cromwell," "Cromwell's Army," and "The Last Two Years of the Protectorate." Charles II's reign may perhaps best be read by combining *Airy's* edition of *Burnet*, "History of My Own Time," with *Ogg*, "The Reign of Charles II." *Masson*,

"Life and Times of Milton," *Feiling*, "The Tory Party, 1640-1714," and *Forcroft*, "Halifax," illustrate the origins of party; *Braithwaite*, "The Beginnings of Quakerism," *Trevor-Roper*, "Laud," *Shaw*, "The Church under the Commonwealth," and *Bate*, "The Declaration of Indulgence," for different angles of the religious problem.

C. Constitutional History. *Tanner*, "Tudor Constitutional Documents," *Gardiner*, "Constitutional Documents of the Puritan Revolution," and *Grant Robertson*, "Select Statutes, Cases, and Documents," give a body of important texts, with introductions and notes; *Hallam*, "Constitutional History," the view of a Whig of 1832, is always suggestive: a more modern outlook and new light on special problems, may be found in *Mellhuish*, "The High Court of Parliament," *Reid*, "The King's Council in the North," and *Evans*, "The Principal Secretary of State." For general reference see *Keir*, "Constitutional History of Modern Britain," and *W. S. Holdsworth*, "History of English Law," which shows the struggle between Common Law and its rivals.

D. Among other works deserving mention in regard to particular aspects. *Maynard Smith*, "Pre-Reformation England"; *Cunningham*, "Growth of English Industry and Commerce"; *Lipson*, "Economic History of England," Vols. II and III; *W. R. Scott*, "History of Joint-Stock Companies," Vol. I; *Tawney*, "The Agrarian Problem in the 16th Century"; *Hume Brown*, "History of Scotland," Vol. II; *Hooker*, "Ecclesiastical Polity," Book V (ed. Church and Paget); *Corbett*, "Drake and the Tudor Navy"; *Williamson*, "British Expansion," a short exposition of a subject more fully dealt with by *Osgood*, "The American Colonies in the 17th Century"; *Lecky*, "History of Ireland," has a résumé of the whole period, while more detail is in *Bagwell*, "Ireland under the Tudors," sections of *Gardiner's* works, and *Burghclere*, "Ormondo." The *Cambridge History of English Literature* may be consulted for full account of originals and modern books. Of modern works upon the political ideas of the age, reference may be made to *Figgis*, "The Divine Right of Kings," and *Gooch*, "English Democratic Ideas in the Seventeenth Century."

INDEX

(This index contains only selected details. Main subjects and persons will be found by means of the chapter headings.)

to James II, explains clauses in the secret negotiations of 1669-71, for the English acquisition of Sluys and Walcheren, of Ostend, Minorca, and Spanish America.

In 1673 Charles was compelled by Parliament to abandon a game which had misconceived both the English temper and the French power, and Danby returned to the anti-French policy of his friend Temple. His understanding with William of Orange, to make Charles join a European coalition, culminated in 1677 with William's marriage to James' daughter Mary, but the mutual distrust of King and Parliament destroyed the alliance, and Danby with it. For the next four years the Popish plot realized Louis' ideal, of an England crippled by internal disorder; for four more years again, Charles allowed France to master Europe by refusing to meet his Parliament.

Titles of affection, *pater patriae* and the like, are given to rulers who confer, or coincide with, an increased material wealth, and the England of Charles II was rich while the Crown was poor. Commerce had become the director of national policy. The City, great moneyed men like the Childs, Papillons, or Houblons, the East India Company, were powers comparable to the legislature; the

to James II, explains clauses in the secret negotiations of 1669-71, for the English acquisition of Sluys and Walcheren, of Ostend, Minorca, and Spanish America.

In 1673 Charles was compelled by Parliament to abandon a game which had misconceived both the English temper and the French power, and Danby returned to the anti-French policy of his friend Temple. His understanding with William of Orange, to make Charles join a European coalition, culminated in 1677 with William's marriage to James' daughter Mary, but the mutual distrust of King and Parliament destroyed the alliance, and Danby with it. For the next four years the Popish plot realized Louis' ideal, of an England crippled by internal disorder; for four more years again, Charles allowed France to master Europe by refusing to meet his Parliament.

Titles of affection, *pater patriae* and the like, are given to rulers who confer, or coincide with, an increased material wealth, and the England of Charles II was rich while the Crown was poor. Commerce had become the director of national policy. The City, great moneyed men like the Childs, Papillons, or Houblons, the East India Company, were powers comparable to the legislature; the
